SURGEON LEA of H.M.S. *Ringarooma* was on April 30th last tried by court-martial at Sydney on charges of insubordination and contempt in regard to his superior officer, Captain S. A. Johnson, in command of that vessel. The trial lasted three days and resulted in the following sentence: "The court, having unanimously found the charges against the prisoner proved, commands him to be dismissed from Her Majesty's service." The sentence was subsequently confirmed by the admiral. But the matter cannot be allowed to end here. We have carefully read the evidence and proceedings as reported in the *Naval and Military Record* of the 13th inst. Surgeon Lea represented that it was essential to his case, and for the justification of his conduct in the matter, that the state of health of Captain Johnson should be made the subject of evidence and investigation, but the court held that the question of the health of the captain was immaterial and had nothing to do with the charges on which Surgeon Lea was being tried, and refused to go into the subject. Surgeon Lea was told, however, that he could, in the course of any statement he might make, bring the question of the

captain's health before the notice of the court. It is stated that he had over fifty witnesses, including many medical men, but as much of their evidence bore upon the mental condition of Captain Johnson it was refused by the Court. In the course of his statement in his defence, Surgeon Lea urged that at the time of the occurrence out of which the charges arose the captain was mentally deranged and unfit for duty, and in corroboration of the correctness of this opinion he entered very fully into what may be termed the previous medical history of this officer. Moreover Surgeon Lea urged, and was able to prove, that he was himself subsequently transferred to the *Dart* and unconditionally released from arrest by the commander of that vessel. The evidence and proceedings of the court-martial as recorded by our Service contemporary are presumably incomplete. Under all the circumstances of the case, and considering the unsatisfactory nature of the evidence, and that Surgeon Lea has served nearly twelve years in Her Majesty's Navy with an unblemished record and is very heavily punished by the sentence of the Court, we are decidedly of opinion that the matter calls for further careful investigation by the Admiralty authorities in this country.

EYESIGHT AT SEA.

WE should much like to know what action has been taken by the President of the Board of Trade in regard to the testing by an expert of the vision of sailors both as to acuteness and to colour. It will be remembered that on Feb. 1st last a deputation of nearly all the most distinguished ophthalmic surgeons in Great Britain waited upon the President of the Board of Trade and strongly urged him to take immediate steps to subject everyone whose avocation is to conduct or control traffic, whether at sea or on land, to tests which should be at least sufficient to protect travellers from preventable causes of disaster. It cannot be too strongly insisted on that the great ocean steamers move at the rate of from fifteen to twenty miles an hour, and that consequently when two are steaming in opposite directions they approximate at the rate of a mile in two minutes or less, so that a look-out whose vision is six-twelfths—a defect that is by no means uncommon—would have very few minutes to distinguish and avoid a vessel steering stem on in the opposite direction. Mr. Caldwell's letter in our issue of last week is sufficient, even if it stood entirely alone, to show the imminence of the danger to which all passengers are constantly exposed. In that letter Mr. Caldwell states that on a trial trip he discovered a fresh hand who was the possessor of a glass eye. This circumstance led him to examine all the men on duty for that night, with the result of finding that the man on the opposite side of the bridge also had imperfect vision. These men were excused from night duty; but the very next night, whilst running down the Channel, the Cunard liner on which Mr. Caldwell served missed almost by a hair's breadth a collision with an East Indiaman. Mr. Caldwell justly remarks that it is impossible to say what would have been the result if these two men with imperfect vision had been on the look-out that night. But if short shrift is allowed to those with imperfect sight at sea to determine the course and position of an opposing vessel, how much more necessary is quick and accurate vision and correct perception of colour in those who drive our modern railway engines when running at from fifty to sixty miles an hour. Instead of minutes, a few seconds may here lead to vast loss of life and property. Every engine-driver and every stoker, for if the engine-driver breaks down the stoker must act, should have perfect distance and perfect colour vision. Sooner or later this must be ascertained. Sooner or later an expert must be appointed, and if this is to be done why then should it not be done before rather than after the

¹ THE LANCET, June 15th, 1895.

accident which, without such supervision, is sure to come? From Mr. Stuart Brooke's letter in our last week's issue the East Indian Railway, the largest undertaking of the kind in India, has made its medical officers responsible for the sight and colour vision of its employes, and has thus made every endeavour to protect the travelling public from accidents attributable to this cause. If it can be done in India why cannot it be done in England? We travel more than any other nation in the world, and it is only right and fitting that our risks should be reduced to a minimum.

THE ABUSE OF STREET COLLECTIONS.

It may seem ungracious to check the kindly impulses of the charitable, but we must enter a grave protest against the growing practice of street collections, which, if permitted to continue uncontrolled, can only have one effect, and that a disastrous one, upon the cause of charity itself. It would almost seem as if the promoters of charities of all kinds, good, bad, and indifferent, had found it to be more profitable for the cause they champion to sit at the street corners or perambulate the footways with money-boxes than to deluge the householder with circulars and appeals. Doubtless they are justified from their standpoint in this change in their mode of attack upon the purse, but its very aggressiveness will in time do much harm to collective charity. The "man in the street" will not discriminate between the different objects for which he is importuned in this fashion, and, following the wholesome rule he applies to the vagrant beggar, he will resolutely abstain from responding to any such appeal in person. We fear, too, that the abuse of this practice will react injuriously on causes which really deserve recognition, and that the apathy of the Londoner, which has been so strikingly evinced in respect to Hospital Sunday, will be confirmed and extended by reason of this importunity.

THE ORIGIN OF MASSAGE.

DR. FORESTIER of Aix-les-Bains has an interesting paper in *Le Progrès Médical* of May 25th last on the Origin and Terminology of Massage. The physician of l'Hospice Evangélique is of opinion that the method of treatment now known as massage was first introduced into Europe by some of the returning members of Bonaparte's Egyptian expedition of 1799, and relies for his information upon a book entitled "*Des Eaux Thermales d'Aix en Savoie*," published at Chambéry in 1808. Dr. Daquin, the author of the work in question, after a passage *à propos* of the douche, speaks of the manipulations and frictions which were observed by Captain Wallis amongst the aborigines of Otaheite, and then proceeds as follows: "Those who followed the Emperor Napoleon in Egypt inform us that this method was also in existence amongst the people of that country, and that it was employed after the bath; the name of *massement* has been given to it, and it is administered to the person whom they want to *masser* by rubbing successively the entire surface of his body. According to this account I think that this operation, which strikes me as a very salutary procedure, might with great advantage be put in practice, after their bath or douche, upon those who make use of our thermal waters." Dr. Forestier is satisfied that this evidence is conclusive; but if confirmation of the antiquity of the term massage be needed it is forthcoming. In 1838 Dr. Despine produced a work under the title, "*Observations de Médecine Pratique faites aux Bains d'Aix en Savoie*" (Annecy, 1838), and in it the following passage is to be found: "Since the renaissance of our Thermes in 1816 we bathe and we douche we scrub, we *masse*, we *stew*." As regards the etymology of the words *massage*, *masseur*, &c., Dr. Forestier believes that they are derived from the

Arabic by a species of transliteration. He has been told by a native of Egypt that at the present time the word "*matz*" is used to indicate the operation of massage, and seems to pin his faith to the assertion. We are not aware that there is such a term current in modern Arabic, but there is another way of accounting for the origin of the name "*masseur*" which we have much pleasure in bringing to Dr. Forestier's notice. The country which we call Egypt is, in reality, Masr, which is commonly pronounced *Musser*. If the process of massage was really introduced by one of Napoleon's Savoisien medical men, what more natural than the bestowal upon its professor of the name of the country whence he brought it: the new art hailed from Musser, and hence the person who practised it came to be called a *masseur*?

THE NEW LOWER SCHOOL AT THE ROYAL MEDICAL BENEVOLENT COLLEGE.

HIS ROYAL HIGHNESS THE PRINCE OF WALES, whose interest in medical politics has before now been prominently manifested, has consented to lay the foundation stone of the new lower school buildings at the Royal Medical Benevolent College, Epsom. The day fixed for the ceremony is Tuesday, July 9th, and full details will shortly be issued. It is an interesting coincidence that about forty years ago His Royal Highness was present upon the occasion when his father, the Prince Consort, opened the buildings of the original Royal Benevolent College. The Prince Consort had by previous promise arranged to lay the foundation stone of the building, but was prevented from doing so by an attack of measles.

THE EVICTION OF MR. T. M. WATT.

THE eviction of a medical man from his home may be the greatest hardship that can be inflicted upon him, and from the case of Mr. T. M. Watt no single element of hardship would seem to be absent. He has resided at Hovingham for twenty-four years, and has now been turned out of his house by his landlord, Sir William Worsley, whose opponent he has been in rural politics. He had invested all his capital in his practice, and the action of Sir William Worsley must go far to deprive him of his livelihood, for on geographical and other counts no chance remains for him in an attempt to hold his own against a rival established in his old headquarters. With regard to Sir William Worsley's perfect legal right to treat his own property as he chooses and to re-enter into its possession at any time that his legal covenants permit him to do so, there can be no question. On a minor point as to the correctness of the wording of the notice to quit, the legality of his action was unsuccessfully disputed by Mr. Watt; but on the broad case there can be but one opinion—Sir William Worsley has acted within his legal rights. We propose to consider his conduct, however, on the lines of his duty towards his neighbour, and viewed in the light of the written words of the Book of Common Prayer and the unwritten code of common sense we find Sir William Worsley, wanting in charity and reason. It has been Mr. Watt's duty, as he conceived it, to oppose the head of the village in questions of rural policy. Therefore he must go. We cannot conceive a step more damaging to the order to which Sir William Worsley belongs—the English squirearchy of which it was an English fashion to be proud—than such arbitrary exercise of authority, albeit legal. Why should Sir William Worsley judge for the villagers of Hovingham and district what medical man they should employ? But by driving out Mr. Watt and supporting a successor to him that is precisely what he will do. And in questions of public health, why should not the medical man, who knows the technical

ins-and-outs of hygienic questions, attempt to secure for his patients the most sanitary environments in his power? He would be wanting in his duty to those under his charge if he did otherwise. The indignation of the neighbourhood has been gravely roused at Sir William Worsley's behaviour, and we are not surprised to learn it, for a more high-handed course of action than that pursued by him has never come under our notice. We speak from the statement laid before us by Mr. Watt, which, we may add, has been widely disseminated for some days in a very important local paper—the *Leeds Mercury*. The statement has, we believe, never been denied, and we are compelled, in registering our heartiest sympathy with Mr. Watt, to believe that no denial is possible.

THE DWELLINGS OF THE POOR.

THE need of comfortable and home-like dwellings for the poor has been so often and so urgently insisted on that it seems a work of supererogation to refer to it again. Despite all the efforts that have been made, the money that has been spent, and the labour that has been ungrudgingly given, an enormous amount still remains to be done, and one of the agencies for lessening this amount is the body whose report for 1894 lies before us—namely, the Mansion House Council on the Dwellings of the Poor. This council takes note of insanitary houses and arrangements and calls the attention of the local authority to the same. If no good result follows this step the members of the Council take the matter into their own hands. One important point upon which the report lays stress is the need of one uniform standard of sanitation for London so that the present diversity of opinion, by which one magistrate upholds what another will condemn, may be done away with. The report mentions with righteous praise the "cottage homes" projected and worked by Miss Octavia Hill. These homes are artistic, comfortable, and infinitely more homely than the barrack-like "models" which exist in so many parts of London, and, we are sure, exert a far greater influence for good on those who live in them.

HOUSE SURGEONS AND CORONERS' INQUESTS.

THE question of the payment of members of the resident staff of a hospital for evidence at inquests is always arising. Last week the house surgeon of the Metropolitan Hospital, having been required to make a post-mortem examination on a patient who died in that institution, and to give evidence at the inquest, complained to the coroner that he received no fee, and mentioned that the necropsy alone had kept him for three hours from his ordinary duties. The coroner, Dr. Wynn Westcott, expressed his regret, but declared that he had no power to allow the witness a fee. The law on the subject is contained in the Coroners' Act of 1887 (50 & 51 Vict., cap. 71), which, after mentioning the fees which may be paid to medical witnesses at inquests, has the following paragraph: "Where an inquest is held on the body of a person who has died in a county or other lunatic asylum or in a public hospital, infirmary, or other medical institution, or in a building or place belonging thereto or used for the reception of the patients thereof, whether the same be supported by endowment or by voluntary contributions, the medical officer whose duty it may have been to attend the deceased person as a medical officer of such institution as aforesaid shall not be entitled to such fee or remuneration." The injustice of such a practice is obvious, for not only has the house surgeon often to go some distance to attend the inquest, but he is liable to a fine of £5 (as the very next paragraph declares) should he not obey the summons. If the death occurs just outside the hospital the house surgeon, if called as a witness,

does receive a fee, but if the patient dies five minutes later no fee can be demanded. The resident medical officers of hospitals, like the majority of medical men, do a great deal of work for which they do not receive any remuneration, so that it is unreasonable to ask them even to give evidence without a fee; but it is still more unjust to expect them to perform post-mortem examinations without any remuneration.

"THE HOMŒOPATHIC TREATMENT OF DISEASE."

UNDER this title there appeared in the *Echo* of May 29th a letter signed "Arthur de Noé Walker, M.D.," announcing on "reliable" authority "from Italy that Professor Baccelli, teacher and lecturer of (*sic*) clinical medicine at Rome and Minister of Public Instruction, has instituted a 'Cathedra (*sic*) Omeopatica,' aggregated to the University of Naples and already frequented by about 200 students." Inquiry at headquarters—"Il Direttore della Segreteria della Regia Università di Napoli"—has elicited the brief but conclusive statement "che in questa Università non c'è insegnamento di medicina omeopatica" (that in this university there is no instruction in homœopathic medicine). From all that we know of his Excellency Dr. Baccelli, a homœopathic chair is about the last adjunct to medical teaching that he would institute. As President of the Accademia Medica di Roma and as sometime Professor of Clinical Medicine in the Roman school his precept and practice are as diametrically opposed to the "homœopathic heresy" as the most rigid allopath could desire. The announcement, indeed, that he had affiliated to the Neapolitan school a chair of homœopathy is about as credible as would have been the statement that to the nineteen sections into which the work of last year's International Congress of Medicine and Surgery was distributed he had added a twentieth in honour of the disciples of Hahnemann.

MUSIC IN MEDICINE.

OUR genial and inimitable contemporary *Mr. Punch*, amongst whose warm admirers we are glad to rank ourselves, makes the suggestion that music may have some therapeutic virtue the subject of a most amusing sketch in his issue of June 8th. It takes the form of "Notes from a Patient's Diary." On Monday "feel rather out of sorts to-day; send round for the doctor. He shakes his head gravely and produces stethoscope. I protest that there is nothing wrong with my lungs, but he explains that he treats all his patients by music nowadays; supposed stethoscope turns out to be a cornet on which he performs selections from 'Il Trovatore' for my benefit. Later on in the day a small musical-box arrives, labeled 'to be taken twice a day.' Find it only plays one tune out of 'Rigoletto.' Pitch it out of the window." Tuesday and Wednesday witness various adventures in the pursuit of music as a remedy. On Thursday the patient "is aroused by five barrel-organs performing simultaneously under my next-door neighbour's window. Send a note round suggesting that they should be dispersed. Answer, 'Sorry to cause annoyance, but our youngest child is suffering from chicken-pox and has been ordered street music every three hours.' Go out to buy an air-gun. Later in the day, happening to take up THE LANCET at the club, I find a long article on 'The Treatment of Pleurisy by Beethoven's Fifth Symphony in C Minor.'" Friday's adventures are not less diverting, and our only regret is that our contemporary did not pursue the subject further. The sketch is a good example of the admirable humour in which *Mr. Punch* is unrivalled. To reply seriously to such genial satire would argue unusual obtuseness on our part. The rôle of music as a therapeutic agent is, no doubt, a very limited one, and its application to, say, pleurisy had not occurred to us until we read our contemporary's article! The medical

profession is accustomed to suggestions from outsiders, and can only regret that such suggestions so seldom add to the resources at its command. If on some future occasion we should recur to the subject of the less familiar *armamenta medicinae* we might do worse than give honourable mention to the perennial stream of pure and never vulgar wit which flows from the columns of our leading comic journal. We know of no better remedy for the fatigue that comes of incessant literary work than to dawdle over an old volume of *Mr. Punch*—and is he not seen in the waiting-room of every consultant?

THE YORKSHIRE BOILER EXPLOSION.

THE village of Warrenby, some two miles from Redcar, has been the scene of a most appalling and probably the most destructive boiler explosion that has ever occurred in the North of England. On Friday, the 14th inst., at about half-past nine o'clock in the evening, twelve of the fourteen boilers attached to four furnaces in full blast at the Redcar Iron Works suddenly burst, with the result that nine men have lost their lives and others have been terribly injured. The boilers were of the "egg-end" type, 60 feet long and 4½ feet in diameter, placed close together side by side. The pressure per square inch has ordinarily been 60 lb., and the boilers have, it is stated, been officially inspected regularly once a month. So great was the explosion that five of the boilers were lifted from their beds and forced backwards to a considerable distance, while brickwork and pieces of iron were hurled for distances of 200 yards or more. This very great violence, however, singularly enough, probably lessened the number of casualties, for many of the missiles were carried far above the heads of the workmen, and had it not been for the flood of boiling water in which the men standing near were caught the damage to life would no doubt have been surprisingly small. About 400 hands were employed at the works, and as it will be some months before the damage can be fully repaired the distress in the little village of Warrenby, which practically owes its existence to the ironworks, is likely to be great. Until the Board of Trade's report is announced it is impossible to state the cause of the catastrophe, but the terrible disaster furnishes a lesson which should not be passed unheeded. Soon after the accident a large staff of medical men were on the spot, but the injured who could not be taken to their homes had to be carried on stretchers through Redcar to the North Ormesby Cottage Hospital. Surely near all large works where a number of workmen are employed some better provisions might be made for cases of this kind, and we trust that workmen will move in the matter in their own interests.

THE DUTY OF ATTENDANTS ON THE INSANE.

WE have received from Messrs. Potter, Batten, and Davis, of Clapham Common, a copy of an address to asylum attendants by the Rev. Henry Hawkins, Chaplain of the London County Asylum, Colney Hatch. This address, dedicated by the well-known Chaplain of Colney Hatch to his fellow workers among the infirm in mind, is well worthy of consideration by all attendants upon the insane, though it is more particularly directed by title to those who are off duty or invalided. Without taking a formal text he recalls how it was once said to men who were over-wrought, "Come ye yourselves apart into a desert place and rest awhile," and to those asylum attendants who are laid up by illness he gives useful words of advice. We may be allowed to differ from him as to an attack of illness being always a suitable time for the individual to minutely cross-examine himself as to the conduct of his life from the earliest years, such introspection being apt to pass into morbidity;

but we quite agree with him that a temporary retirement from a person's usual occupation may have its profits and advantages. The asylum attendant has not always been, and is not always, strictly mindful of the necessity of conscientiously keeping the rules of the institution he belongs to when his superior officers are out of sight; he may not be considerate to his fellow workers if they are ill; he may be tyrannical to younger attendants or may connive at negligence; and, more important than all, he may not have done his duty to patients in the matter of kindly speaking and in avoiding roughness in handling them, and to all these points the Chaplain of Colney Hatch draws attention. He speaks, further, of the advantage of a season of illness in affording a much-needed rest to mind and body. Asylum attendants are exposed to much wear and tear of mind and body and are in need of frequent opportunities for rest, quite independently of illness. The ordinary hospital nurse has long hours, but is not usually exposed to most irritating abuse, or even personal violence with possibly permanent injury, and has not a constant legal responsibility hanging over her. Mr. Hawkins urges on attendants—and the lesson needs to be impressed upon them not only in sickness but in health—the duties of sympathy with suffering, sympathy with fellow workers, patience, and conscientious work. We are sure that among asylum attendants are to be found many who carry out their duties without the slightest reproach, and the system of training attendants and examining them as to their suitability for nursing the insane which is now carried on by the Medico-Psychological Association tends to add to their number; but there are others for whom the same cannot be said and who would be greatly benefited by a perusal of the address we have been considering, and therefore its circulation among attendants upon the insane would, we think, be productive of good results.

A YEAR OF SUCCESS IN THE PREVENTION OF CRUELTY TO CHILDREN.

NEVER probably during the whole period of its existence has the National Society for the Prevention of Cruelty to Children delivered its annual report in a tone of such exultant gratitude as at its meeting in the Mansion House on May 14th. Nor is it in this without justification, either as regards its social and financial position or the extent and success of its operations. Its income shows an increase of £14,400 on that of last year, and against this there is a relatively marked decrease in expenditure. The number of cases investigated during the year is greater by 3477 than that of the previous year; and it is significant of the judgment exercised by the society's agents that only 4 per cent. of the cases brought into court have been dismissed. Finally, the society has not been forgotten by our Sovereign in the year's distribution of honours, and is to be congratulated on the acquisition of a Royal Charter of incorporation. There need be no surprise, therefore, that so great a measure of success, well-earned as it has been, should have called forth the warmest expressions of satisfaction at the meeting referred to. Lord Iddesleigh and Mr. Rider Haggard both spoke in support of a motion which "would respectfully impress upon magistrates the importance of supporting the society's endeavour to enforce the discharge of parental duty." There is without doubt some ground of necessity for this very moderately worded protest. Some members of the judicial bench, it is to be feared, are still unduly impressed with the sentiment which holds that home is a castle hardly to be entered, even though it be misgoverned by an unnatural parent. It is to be hoped that this fallacy will not long be maintained in the face of both justice and domestic happiness, and that Mr. Haggard's counter maxim, which makes

the child's home to be "much more his castle," will become a part of our national creed. The reluctance of magistrates to convict in cases of cruelty is in all probability due in no small degree to the fact that the children brought before them do not always show the obvious marks of violent ill-usage. Cruelty is capable of many subtle modifications, and the starved, neglected, probably beaten but not disfigured child cannot always express the bitterness of his hard lot so as to secure more than very partial remission of his daily torture or entail any but the lightest sentence on his tyrant. The agents of the society have facilities far exceeding those of the police for arriving at the truth in such matters, and it is due chiefly to their exertions that the majority of cases taken to court, some of them diabolical in their cruelty, have resulted in conviction. We feel assured, therefore, that no true lover of order and justice, or of his fellow creatures will withhold his support from the efforts put forth with tact and discrimination, and happily with much success, by this young but vigorous and deserving society.

THE DIFFUSION OF SMALL-POX.

DURING the week ended June 1st there was only a single case of small-pox in London, and during the whole of the five weeks of May there were only 31 attacks in the metropolis, with but one registered death; the four weeks of April had contributed 37 cases, but no death. The notified cases in the four weeks ended May 18th numbered 40, but half of these were in the two sanitary areas of Holborn and Lambeth. In the first week of June the attacks rose to 5, but still no death occurred, and there was apparently no small-pox in the suburban districts. Last week there were half-a-dozen cases in London and a single registered death from the disease—namely, in a person aged between twenty and forty years and stated to have been vaccinated, the individual belonging to the Hammersmith sanitary area. In the southern midlands there was but little small-pox last week or in recent previous weeks, and Bedford seems to have all but got rid of the outbreak that threatened for some time to become serious. But at Derby matters have not very materially improved, there having been upwards of 60 cases in the last six weeks; a few days since there were 42 patients in hospital, although the building is, it is said, intended only for 40 cases at one time. In these circumstances the town council decided to purchase one of the wooden wards recently used at the infirmary and to remove it to the hospital site. The original case is now stated to have given rise to thirty-seven other cases in a more or less direct manner, one of the last of these being a barmaid at the public-house in the centre of the town which the first patient had visited. Three fresh cases were isolated last week in the borough, and three deaths were registered, the deaths having occurred on three successive days. At Ripley, near at hand, a further case having developed, the district council decided to take proceedings against persons who had exposed themselves under circumstances which seemed to justify action of a penal character, after payment made by the council with the view of curtailing the chances of spread of infection by the movements of the persons in question. At Belper last week a case of small-pox occurred in a man who had held office in a lodging-house at Ripley. He was admitted to the casual ward, but later the council decided to rent a cottage near the town and therein isolate the patient, the medical officer fearing lest some epidemicity of the disease should ensue by reason of its appearance among the vagrant class in the neighbourhood. Small-pox has also recently been introduced into the Hayfield Workhouse in the person of a vagrant on the same day that two inmates were buried after succumbing to the malady, other inmates still being sufferers from the disease. A

case has been notified at Rawmarsh recently, the victim being a professional singer who had in the preceding few weeks fulfilled engagements at Derby, Ripley, Ashton-under-Lyne, and Barnsley, in addition to visiting other places, while the eruption was out. The family with whom she stayed in Rawmarsh just prior to her case being diagnosed have been placed in quarantine. In Lancashire several places have had experience in small amount of the disease during recent weeks, including Manchester with two cases last week, and one in each of the two preceding weeks, all removed to Clayton Hospital; and Salford, Wigan, Bolton, and Oldham, a death being registered in each of the latter two places a fortnight ago, and a further death in Oldham last week. In the large towns of Scotland there were 3 deaths from the disease in May, 2 of them in Glasgow and 1 in Edinburgh. In Dublin in the two latter weeks of May the admissions of small-pox patients to hospital showed some fluctuation, the number in the first of the weeks having been 16 in excess of that immediately prior, while in the week ended June 1st the admissions fell again from 28 to 10, the patients discharged numbering 21 and one death occurring, and the cases remaining in hospital being 41 acute, with other 34 convalescent patients at Kilmainham. Later records show still further improvement.

ACCIDENTS CAUSED BY CURETTING THE UTERUS.

THERE is an interesting paper on this subject by Dr. R. Pichevin in the May number of the *Annales de Gynécologie et d'Obstétrique*. Among the ill consequences that have resulted from curetting he enumerates: 1. The production of abortion from the untimely introduction of the curette into the pregnant uterus. 2. Serious after-effects, and even death, from want of observance of strict antiseptic principles. 3. The rupture of a collection of purulent matter encysted in the immediate neighbourhood of the uterus,—pyo-salpinx, for instance. Should such an accident be thought to have occurred he advises either immediate laparotomy or vaginal hysterectomy. 4. In very rare cases uterine atresia has been produced by, or has followed curetting. 5. The most frequent accident has been perforation of the uterus by the curette. The consequences of this accident have generally been insignificant; indeed, according to Dr. Pichevin, a Vienna gynaecologist was in the habit of pushing the sound through the uterus into the peritoneal cavity with the object of demonstrating the harmlessness of the proceeding. No doubt it is harmless in a large proportion of cases; but Raffay in a recent thesis, while reporting three cases that recovered, records one also where death occurred. It seems clear that perforation by the curette is more likely to take place when curetting is done after a confinement at term, or after premature delivery, than when performed after an abortion in the earlier months. As regards the causes of perforation, sometimes it may be due to want of skill or care on the part of the operator; in some cases it may be due, as Auvard has insisted, not to the curette, but to the method of dilatation employed prior to the curetting. Metal dilators with expanding blades are very likely to cause such an accident, but it has been known to occur when the dilatation was effected by Hegar's dilators. Auvard, it will be seen, thinks the curette merely discovers a perforation that has been already made. We referred to his views in THE LANCET not long since. Finally, it seems that there are certain very rare cases where the wall of the uterus is so thin at some point that perforation may be inevitable, no matter how gently the curette be used. The diagnosis of perforation may sometimes be made erroneously. Several authorities have noticed a sudden enlargement of the uterine cavity to occur during curetting. This, of course, allows the

curette to pass in much further than before, and might easily lead a nervous operator to think he had perforated the uterus. A correct opinion may be formed by ascertaining the length of the cavity with the sound at two or three different points.

THE HEALTH OF PROFESSOR HUXLEY.

It is with great regret that we learn as we are going to press that the health of Professor Huxley gives ground for anxiety. It is true that the pulmonary troubles upon which we commented when referring to his illness some six weeks ago have not returned, but the evidence of renal insufficiency is very clear, and the condition is accompanied by anasarca and marked failure of physical strength. Professor Huxley's mind remains perfectly clear.

URTICARIA AND URIC ACID.

THE *New York Medical Record* of June 1st contains a paper by Dr. Elgar J. Spratling of Matteawan State Hospital, Fishkill Landing, New York, suggesting a connexion between urticaria and an undue amount of uric acid in the system. A female patient aged twenty-four, suffering from dementia, was noticed at nine o'clock to be sitting quiet, inattentive, and immobile. At eleven urticarial wheals, raised thickly over the whole face, not previously present, were observed. Such wheals were easily produced in other parts of the body by slight friction. Inquiries as to the personal case of the patient gave no light. She was immediately placed in bed and ten ounces of urine drawn off, having a specific gravity of 1031, highly acid, and containing many crystals of uric acid. Warm water used afterwards for washing out the bladder was found to have a specific gravity of 1003 and to contain uric acid crystals. The bowels were cleared and the patient allowed to remain quiet for twenty-four hours, when the wheals still persisted about the legs and thighs, though not in the face. The urine had now a specific gravity of 1029, and many uric acid crystals. The blood, too, was shown to contain crystals of uric acid. The bladder since the second day was washed out twice daily. On the third day the specific gravity of the urine had fallen to normal, and neither it nor the blood was found to contain any crystals of uric acid. The wheals had disappeared and could not be produced by any amount of friction. The case is interesting as throwing light on some cases of urticaria. But the mode of treatment is not applicable in most cases, even if the causation of all cases were the same, which is doubtful. It is found in practice in many cases that after the failure of what may be called an anti-gout treatment tonics promote the removal of the wheals.

THE DANGERS OF EAR-PIERCING.

THERE is nothing more necessary to our physical well-being than cleanliness. The saying is trite, for we all admit its truth in general terms. Experience is likewise a well-worn authority, and it is somewhat a matter for regret that we should even at this late day have so much to learn from trite experience about the primary duty of being clean. Yet the course of human life is constantly interrupted by incidents and accidents which prove the neglect of this duty. Such, for instance, was the case of an infant who recently died in Hackney from septic or some allied form of poisoning after having her ears pierced for ear-rings. A pawnbroker from whom the earrings were purchased was the operator. A day or two later—that is, about the time when septic mischief if present would show itself—the ear became swollen and ulcerated, and the case, as said, ended fatally. In commenting upon this unfortunate occurrence the coroner's jury held that it was not proper for a pawnbroker or for anyone but a medical man to perform this operation. There is a certain

theoretical correctness in this argument, but it is open to the accusation that in its devotion to pure logic it ignores the reasonable claims of practical convenience and even of possibility. More serious operations than that of ear-piercing, such as circumcision among others, are performed by careful and intelligent laymen duly skilled in their particular office with notable success. Ears have been pierced by jewellers and others for generations, and an accident in its performance must be relatively rare. We cannot, therefore, agree with the jury that medical men are alone capable of this office, which indeed would not be hailed by most of them as a work worthy of high professional intelligence or skill; but, on the other hand, there is not the less, but rather more, need that the person performing it should be careful and capable. Local authorities ought to see to it that they are so, and an offence such as that which proved fatal in the case quoted above should be made legally punishable if it is not such already. A wound—cleanliness; this is the only safe combination, the only safe rule. Its recognition is not for the surgeon only, but belongs to the stock of elementary knowledge which is the common property of all mankind. A dirty wire in the ear, a dirty pin or needle breaking the skin surface may lead to consequences preventable always, but well-nigh irreparable if neglected in their beginnings.

SERUM THERAPY IN PULMONARY TUBERCULOSIS.

WRITING in the *Journal of the American Medical Association* of May 4th, Dr. C. H. Ingraham draws some interesting conclusions from results of his observations on injections of the simple primary serum from the blood of the mule in patients suffering from pulmonary tuberculosis. Although the injections were administered for a sufficient length of time for them to manifest any curative properties, Dr. Ingraham states that he is obliged to record that he did not in any individual case see an improvement that would warrant a continuation of the treatment. The effects produced were as follows: 1. A fine rash producing intense burning or itching, which appeared usually from three to ten days following the first administration, and continued for from three to seven days, when it disappeared permanently. Rubbing or irritation of the rash produced large eruptions having the appearance of "water-blisters," which soon disappeared. The intensity of the eruption bore no proportion to the amount of serum injected. 2. Severe pains of a neuralgic character, which only followed the administration of a large amount of serum. These pains appeared with no regularity whatever, neither were they manifested for any certain length of time. In most cases their severity was governed by the quantity of serum injected. These pains did not yield readily to the influence of opiates or any other treatment. They usually appeared near the site of the injection, but occasionally in a remote region. 3. The typical eruption was accompanied by a pronounced rise of temperature. This rise was also present some hours before the eruption made its appearance. The temperature sometimes reached 104° F., or even higher. It remained at its full height, with little or no fluctuation, until the eruption became less intense. 4. Following the disappearance of the eruption the temperature dropped to normal, or even below. If the case was one of acute tuberculosis and had a high temperature, the diminution of fever was as pronounced as in the milder form. The temperature remained low for two or three days, after which it gradually resumed its former stage. In one or two cases the temperature remained low for nearly a week, but eventually it resumed its former height. 5. Swelling of the extremities, lips, and eyelids sometimes accompanied the eruption, but usually subsided as the eruption disappeared. 6. Subsequent injections of serum did

not cause a second eruption, though the pain was liable to return if too much serum was given.

THE grand bazaar in aid of the funds of St. Mary's Hospital will be opened in the Portman-rooms at 1 P.M. on Thursday, June 27th, by the Princess of Wales, and the programme promises an excellent series of entertainments. Among the lady artistes are Mrs. Clement Scott (who will recite an ode specially written for the occasion by Mr. Clement Scott), Mrs. Bernard Beere, Miss Irene Vanbrugh, Miss Fanny Brough, Miss Geneviève Ward, and Miss Kate Rorke. The dramatic entertainments of Mr. George Alexander and Mr. Yorke Stephens will be given on the opening and following day, and Mr. Wilhelm Granz's grand afternoon concert will take place on Saturday, June 29th. Many other attractions will be provided, and we wish the charity every success.

A SMOKING concert will be given on Thursday, Aug. 1st, at the Portman-rooms, Baker-street, W., under the auspices of the Esculapius Lodge and Chapter in honour of medical Freemasons who may attend the meeting of the British Medical Association. Tickets can be obtained from the Honorary Secretary, Dr. T. Dutton, 7, Portland-place, London, W. Members of the profession applying for tickets should state the name and the number of their lodge and their masonic rank. Masonic clothing will not be worn. Foreign medical masons are especially invited.

DR. VALENTINE BALL, C.B., F.R.S., director of the Museum of Science and Art, Dublin, who died on Saturday last in his fifty-second year, was the son of Dr. Robert Ball, the naturalist, and the brother of Sir Robert Ball, F.R.S., Lowndean Professor of Astronomy at Cambridge, and of Dr. Charles Ball, the well-known Dublin surgeon. He made many important contributions to the science of geology, and his ability as a lecturer on this and cognate subjects was well known.

THE next social meeting of the Hampstead Medical Society will be held at the Conservatoire, Eaton-avenue (near Swiss Cottage), on Tuesday next, June 25th. At 8.30 P.M. an address will be delivered by Mr. Edmund Owen, M.B., F.R.C.S., on "Inflammation of the Shafts of the Bones in Children and Young People," and a discussion will afterwards take place on the subject. The honorary secretaries, Dr. W. Barter and Dr. A. H. Cook, cordially invite the attendance of members and their medical friends.

THE annual dinner of the Epidemiological Society will take place at the Grand Hotel, Trafalgar-square, on Friday, June 28th, at 7.15 P.M. The chair will be taken by the President, Mr. Shirley F. Murphy, and tickets, half a guinea each, may be obtained for members and their guests from Dr. Bulstrode, 4, The Mansions, Earl's-court, S.W.

MR. T. GRIGOR BRODIE, M.D., Lond., has been appointed Lecturer on Physiology at St. Thomas's Hospital, in the vacancy caused by the resignation of Professor Sherrington, F.R.S. The school is to be congratulated on having secured the services of such an excellent teacher.

THE Master of the Salters' Company will distribute the medals and prizes to the students at Guy's Hospital on Wednesday, July 3rd, at 3 P.M. The wards, museums, college, and new laboratories will be open from 3 to 5.30 P.M.

WE are asked to state that Dr. Pringle is resigning his appointment as assistant physician to the Middlesex Hospital, and not that of physician-in-charge of the Skin Department.

THE President, Council, and members of the teaching staff of University College, London, will hold a conversazione on Thursday evening, June 27th.

DR. R. THOBNE THORNE, C.B., F.R.S., has been elected a Foreign member of the Société Française d'Hygiène.

Pharmacology and Therapeutics.

THE QUALIFICATIONS FOR DISPENSING IN UNION AND PARISH DISPENSARIES.

THE President of the Local Government Board has issued to the guardians of the poor of the unions of Birkenhead, Cardiff, London (City), Derby, Fulham, Gloucester, Greenwich, Hackney, Holborn, Nottingham, Plymouth (Incorporation), Poplar, Portsea Island, Reading, St. George's, St. Olave's, St. Saviour's, Stepney, Strand, Walsall, Wandsworth and Clapham, Westminster, Whitechapel, Wolverhampton, and Woolwich; and to the guardians of the poor of the separate parishes of Birmingham, Mile-end Old Town (Hamlet), Paddington, St. George-in-the-East, St. Giles (Camberwell), St. Giles-in-the-Fields and St. George (Bloomsbury), St. Leonard (Shoreditch), St. Luke (Chelsea), St. Mary Abbots (Kensington), St. Mary (Islington), St. Mary (Lambeth), St. Marylebone, St. Matthew (Bethnal-green), and St. Pancras, the following general order, altering the regulations as to the qualifications of dispensers:—

No person shall be qualified to be appointed a dispenser unless he shall be a Licentiate of the Society of Apothecaries of London, or shall hold a certificate of that society as to his qualification to act as an assistant in compounding and dispensing medicines, or shall be a compounder of medicines duly qualified in accordance with the Regulations for the Army Medical Staff Corps, or shall have been duly registered under the Pharmacy Act, 1868, or shall have been duly registered under the Pharmacy Act (Ireland), 1875, and the Pharmacy Act (Ireland), 1875, Amendment Act, 1890, as qualified to compound medical prescriptions.

We think that the expediency of this provision as regards the qualification of future dispensers will be obvious to all our readers, as it is to us.

AIROL.

When one of the groups of hydroxyl in subgallate of bismuth—the so-called dermatol—is replaced by iodine a greenish-grey, inodorous, and tasteless powder is obtained which possesses antiseptic properties and has a great capacity for combining with water, and therefore for drying up moisture. It has been named airol and has recently been employed by Dr. Fahm of Basle as a dressing for wounds, especially for burns and varicose ulcers of the leg, with considerable success. He also gave it internally to a child aged twelve who was suffering from tuberculous enteritis. Three grains twice daily rapidly produced a marked improvement in the diarrhoea and colic-like pains.

GLYCOLYTIC FERMENT IN THE TREATMENT OF DIABETES.

The glycolytic ferment, which was obtained a few months ago by Professor R. Lépine of Lyons by hydrating malt diastase, has recently been employed by him in the treatment of diabetes, the results being sufficiently marked to justify the hope that with more study and greater experience this ferment may prove to be of real value in some forms of this disease. In the four cases which Professor Lépine published in *La Semaine Médicale* of April 24th the diet was first restricted, and when the glycosuria had diminished as much as it appeared likely to do the effect of the ferment was tried. In each case the amount of sugar passed per diem was further diminished, and at the same time the ratio of sugar to urea was reduced. When later the ferment was stopped the patients all passed more sugar than during the treatment. Perhaps the most remarkable case was that of a man aged forty-four years who had been discovered to be diabetic in April, 1894, when he was passing 6 litres of urine per diem. He was put upon a restricted diet, which had the effect of stopping the polyuria

and of bringing the sugar below 50 grammes in the twenty-four hours. In March last he again came into hospital and was found to be passing about 2 litres of urine containing from 40 to 84 grammes of urea and from 29 to 47 grammes of sugar, there being a distinct parallelism between the urea and the sugar, even when as a test 100 grammes of glucose were given, this not increasing the quantity excreted to any great extent, so that the case was pretty certainly one not depending on mere consumption of sugar, but on something connected with the azoturia. Though the man was very stout—weighing 200 kilogrammes—the ferment had a marked effect, reducing the average sugar from 41 to 11 grammes and the percentage of sugar in terms of the urea from 64 to 30. Further, after the treatment was stopped the sugar only rose to 14 grammes, and the percentage of it in terms of the urea to 39. Professor Lépine remarked that the effect of the ferment was less after it had been taken for some days; also that attempts to obviate this by increasing the dose were not successful, so that whatever the action of the ferment might be in the chemical laboratory it could by no means be said that in the system of a diabetic patient the effects were at all proportional to the quantity. Not only, however, were the patients made to pass less sugar by a very small quantity of the ferment, the daily dose being 1 litre of liquid containing 3 grammes of ferment, but at the same time there was a marked improvement in their general condition. It is worthy of remark that no diuresis was produced and no unpleasant effect whatever, so that the remedy is one which may be tried without any misgiving on the part of medical men. The difficulty is to obtain the ferment, which does not keep more than a few hours, and which must be used immediately it is neutralised. If, however, the directions given in Professor Lépine's original paper¹ are closely followed there will be no serious difficulty.

GALEGA AND OTHER GALACTOGOGUES.

Galactogogues are a somewhat unsatisfactory class of drugs, and any light that can be thrown upon them is welcome. Dr. Grinewitch, who has been making a series of experiments upon them, has found that there are a few vegetable drugs which really increase the quantity of milk secreted without in any way acting detrimentally upon it, the specific gravity not being altered and the fat being even somewhat increased. The most efficient of all is a plant which, though it is said to have sudorific properties, is practically unknown in medicine, the common goat's rue (*galega officinalis*). An extract is prepared, and from this a tincture is made containing 65 per cent. of the extract. The dose of this tincture is from 50 to 100 drops repeated five times a day. If preferred, the extract may be prescribed in 4-grain pills, which may be taken from one to four times a day. A syrup may also be made containing 5 per cent. of the extract. The next drug in the scale is the common stinging nettle—*urtica urens*; a tincture containing 20 per cent. of the extract is prescribed in divided doses amounting to from 250 to 500 drops during the day, or a syrup may be employed. Cumin, anise, and fennel are also in the category, and these can be prescribed in powder—15 grains from once to five times daily.

THE ANNUAL REPORT OF THE MEDICAL OFFICER OF HEALTH FOR THE ADMINISTRATIVE COUNTY OF LONDON.

I.

EARLY in the autumn of last year Mr. Shirley Murphy presented to the London County Council his first annual report as medical officer of health for the administrative county of London—namely, that for the year 1892. In noticing that report shortly after publication, we took occasion to congratulate its author on the eminently successful manner in which the several branches of science ancillary to what is included under the term "sanitation" have

been applied by him to the elucidation of the many complex problems which still encumber the path of sanitary progress. We therefore hailed the appearance of Mr. Shirley Murphy's inaugural report as of the happiest omen for the future of public health administration in Greater London. We have recently received the second of Mr. Shirley Murphy's annual reports, which deals with the events of the year 1893. As regards its general scope, and the arrangement of its subject matter, this report closely resembles its predecessor, and in common therewith bears abundant evidence of the patience, diligence, and skill with which it has been prepared. The tables, charts, and other illustrative devices are so arranged as to be really helpful to those readers, whether sanitarially expert or not, who seek instruction respecting the important details which are to be found on every page of the text. It is, further, encouraging to notice, as showing his special fitness for the task of conserving the health of the metropolis, that Mr. Shirley Murphy has throughout appreciated and kept steadily in view the two-fold purpose which reports of this kind should always be made to serve. The prevailing notion, which is probably also that of sanitary authorities generally, would seem to be that the object for which such reports were designed by the Legislature is mainly that of placing on record the useful and praiseworthy official acts of the administrative sanitary authority. But for us, as a profession, it is far more important to remember, and to act upon the knowledge, that in providing for the systematic publication of these periodical reports, and prescribing their general character, it was obviously the paramount intention of the Legislature to secure that the medical officer of health should be encouraged and required to utilise to the uttermost the opportunities thus periodically afforded him of formally and publicly advising his authority, and of imbuing them with scientifically correct notions concerning the direction which sanitary progress should take.

We may truthfully repeat with regard to this report what we said of its predecessor last year—namely, that it appears to us in every way excellent and worthy of the important subjects of which it treats. In accounting for the somewhat late appearance of this second report, Mr. Shirley Murphy pertinently remarks that "the time at which his own annual report can be prepared depends on the date at which the several district reports are received by the Council." It appears that in several instances these necessary contributions are but tardily sent in, and, as a consequence, the appearance of the chief medical officer's report is correspondingly delayed. We therefore agree with Mr. Shirley Murphy in expressing the hope that in future years the earlier receipt by him of the reports of district medical officers of health will enable a report for the entire area of London to be presented with less delay. We are glad to note that the County Council have seen fit to place on sale both these valuable contributions to sanitary literature. The successive health reports may, therefore, be studied with both pleasure and profit by all who take an interest in the health and consequently the prosperity and general well-being of the vast and rapidly increasing population of the English metropolis. In our review of Mr. Shirley Murphy's first report we published in these columns certain extracts and tables from that document with the object of giving some idea of its scope and general character. As we have before remarked, the general plan of the first report has been adhered to in the second; we shall not, therefore, again discuss those points which are common to both reports, and which were dealt with at length in our previous notice. There are, however, certain features in the report for 1893 which appear there for the first time, and which for many reasons are deserving of special consideration. We shall accordingly proceed to notice briefly the more important of these features in ensuing issues.

¹ Archives de Médecine Expérimentale, 1er Mars, 1895.

LOCAL GOVERNMENT (SCOTLAND) BILL.

Now that the Scotch Grand Committee has been appointed the sanitary provisions of the Local Government (Scotland) Bill are likely to come under immediate discussion. It may be recollected that last year's Bill had to be shorn of some of its most useful public health clauses to facilitate its progress towards the statute book. Most of these have now been revived, and a new clause has been added. The Government acted wisely in passing as much as they could of their Bill in 1894, and they are quite right this year to endeavour to bestow on Scotch local authorities certain other powers universally acknowledged to be valuable. Of course it would be much better if, instead of all this piecemeal legislation, a new and complete Public Health (Scotland) Act could be passed, but at present this is not to be looked for, and in the domain of State medicine small mercies in the way of legislation have often to be accepted.

The procedure necessary for the compulsory acquirement of land by local bodies has hitherto been so cumbersome and so costly as to cause it to be comparatively seldom taken advantage of. In particular, the provision of hospital accommodation for infectious diseases has been greatly retarded in this way. The present Bill provides the necessary remedy. Under it there would no longer be need for going to Parliament for a Provisional Order. The court of appeal would be the Local Government Board. In the event of a public inquiry being demanded, the person holding such inquiry would be paid at no higher rate than three guineas a day, no expert witnesses would be heard, and in determining the amount of compensation no allowance would be made in respect of the purchase being compulsory. This last proviso would not, we presume, exclude from consideration the question of the purpose for which the land was to be required, and of possible depreciation in the value of immediately adjoining land belonging to the seller—say, by the erection of a fever hospital.

Section 9 proposes to give to county councils the long-demanded right to make by-laws regarding new buildings; but the powers specified are very defective. There is not a word about such absolutely essential matters as the prevention of damp, or ventilation underneath floors. This being so, it would be too much to look for provision as to building materials, thickness of walls, or prevention of fires. No doubt such omissions are intended to conciliate possible opposition, but the sacrifice at the shrine of compromise is here far too great to be justified by the value of all that is left in the clause. It is hardly conceivable that this part of the Bill will not be greatly strengthened in Committee, especially as county councils are intended to have the power to restrict their regulations to particular districts. The whole section should form a complement to the Housing of the Working Classes Act, and should in all respects be framed so as to operate in entire harmony with that Act.

It is a standing grievance of the medical officers of the northern kingdom that whether or not they are to be furnished with regular returns of births and deaths depends wholly on the goodwill of the local registrars, and that, as a matter of fact, many registrars refuse to make such returns on such terms as are fixed by law in England. This also will be remedied if the new Bill becomes law; but might we be allowed to say a word for the registrars of small rural districts whose fees under the terms as laid down in the Bill might only amount to four or five shillings a year? Surely a monthly or annual minimum could be fixed which would make it worth the registrar's while to keep in mind his monthly or quarterly duty of sending perhaps a blank sheet to the health officer.

Clause 11 deals with dairies, and is of much importance. The control which local authorities have over milk-supply is at present indefinite and unsatisfactory. Under the Dairies Orders various sets of by-laws, more or less stringent, have been agreed to and issued by sanitary boards all over the country. In connexion, however, with an action raised by the town council of Edinburgh it was lately shown that such by-laws may readily be *ultra vires* of the bodies enacting them, and if the Orders under which by-laws are made were themselves extended in their scope they in their turn might be held to be *ultra vires* of the Acts of Parliament under

which they are made. It is, therefore, highly desirable that such powers as sanitary authorities are intended to possess should be placed at their disposal in clear and unambiguous fashion. Clause 11 of the Bill is, with some modification, similar to Clause 71 of the Public Health (London) Act of 1891. It provides that where a medical officer has evidence of infectious disease in his district attributable to milk supplied from a dairy *within or without the district* he shall have the right of inspection, and that if as a result of inspection he forms the opinion that infectious disease is caused by, or is likely to arise from, consumption of the milk he shall report to his local authority, who may then call on the dairyman to show cause why an order should not be made requiring him temporarily to cease supplying milk within the district of the local authority. There is no doubt that small rural authorities tend to be negligent of dairy supervision, and that the consequences of their negligence are often primarily felt, not in the district in which a dairy is situated, but in the district in which the milk is sold. In these circumstances it is probably right that London sanitary authorities should have power to go outside London to examine country dairies from which milk is sent to them and where suspicion of disease-conveyance exists. It seems likely, however, that very many of such dairymen will be in the habit of sending milk only to the district of a single metropolitan authority, so that this right of supervision will fall to be exercised by only one body outside the dairyman's own district. But in Scotland we can understand that the case may often be different. There the districts in which the dairies are situated are those under the charge of the district committees of county councils, and, as a rule, consist of large areas with active local authorities and a proper staff of officials. On the other hand, the districts within which the milk is sold may be small burghs, scattered throughout the country districts, but having local authorities of their own entirely independent of the county council. Milk from one large dairy farm may be sent to several of these burghs, and, in this way, it seems possible that a dairyman might be put under the control of a variety of public bodies, perhaps with divergent views and different dairy regulations, and perhaps also ill qualified to look after their own sanitary affairs, let alone the sanitary affairs of the district committees of county councils. There is not much fear that the health departments of large cities like Glasgow, Edinburgh, Aberdeen, &c. would act unreasonably regarding dairy farms outside their own districts, though, no doubt, they would insist on proper precautions against risk of disease-conveyance. But as to small burghs there could be no such certainty. After all, a dairyman has rights as well as obligations in this world, and it does seem as if hardship might arise from his being called on to fulfil the various demands of various authorities, who might be led by the deficiencies of their preventive arrangements to make altogether unjustifiable demands on outsiders. Perhaps Clause 11 might work well enough in practice, and such contingencies as are here indicated might seldom become actualities. But the fact that such a clause is proposed points to two conclusions—one that county committees, if they wish to retain full control over their own districts, must see that the dairies under their charge are thoroughly in accordance with the requirements of modern sanitary knowledge; and the other that small burghs should for health purposes be incorporated with the county district in which they are situated. In this connexion it is satisfactory that the present Bill does not include Section 63 of last year's Bill, which was among those not then passed into law. Section 63 tended to the total administrative dissociation of small burghs from the country districts. No doubt at present the relationship is unsatisfactory; but the remedy is to be found, not in separation, but in combination, more or less complete, for all public health purposes.

On the whole, the present Bill is a good one and ought to become law, but it ought not to pass through the Grand Committee without such questions as are here raised being well and carefully considered.

MR. GERALD BALFOUR, M.P., will preside at a meeting to consider the work of the Metropolitan Provident Medical Association at 12, Portman-square, London, to-day (Friday), at 4.30 P.M. He will be supported by Lord Battersea, the Rev. Canon Ainger, Sir J. Russell Reynolds, Mr. Lewis McIver, M.P., and others.

METROPOLITAN HOSPITAL SUNDAY FUND.

THE following are some of the principal amounts received at the Mansion House, the lists of which have been received at THE LANCET Office, up to the time of our going to press on Thursday, when the total amounted to nearly £15,000. The total sum recorded at the corresponding period last year was £14,000:—

	£	s.	d.		£	s.	d.
St. Michael's, Chester-square (Archdeacon Fleming) ..	1174	9	0	Christ Church, Beckenham (Rev. J. Harding)...	37	8	6
Westminster Abbey (Dean of Westminster) ...	224	0	0	Mitcham Church (Rev. D. F. Wilson) ...	72	19	0
St. Paul's Cathedral ...	253	17	8	The Oratory, South Kensington (Rev. W. Gordon) ...	54	6	0
Chapel Royal Savoy ...	16	0	0	The Vicarage, Hford (Rev. H. W. E. Molony) ...	28	7	11
St. Margaret's, Westminster (Ven. Archdeacon Farrar) ...	161	11	11	Morden College, Blackheath (Rev. H. Lansdell) ...	7	10	6
Spurgeon's Tabernacle ...	80	0	0	Christ Church, Southgate (Rev. Cyril F. Wilson) ...	43	3	3
Metropolitan Tabernacle (Rev. Thos. Spurgeon) ...	130	0	0	Harrow Weald Church (Rev. W. H. Peers) ...	18	3	3
St. George's, Bickley (Rev. R. Wood) ...	70	3	3	All Saints', Friern Barnet (Rev. H. S. Miles) ...	43	4	5
Christian Evidence Society, East London Branch ...	44	0	0	St. Peter-al-Vincula, Tower, E.C. (Rev. C. A. Solbe) ...	15	0	0
St. Saviour's, Clapham (Rev. C. P. Green) ...	27	17	3	Christ Church, Rotherhithe (Rev. St. Martyn Bardsley) ...	15	9	1
St. Saviour's, Southwark (Rev. W. Thompson) ...	24	8	4	Church of Our Lady, Sydenham-road (Rev. F. Minnett) ...	7	11	9
All Saints, North Peckham (Rev. W. R. Finlay) ...	45	4	6	Dulwich College Chapel (Rev. G. W. Daniell) ...	56	19	0
St. George's, Beckenham (Rev. H. Arnott) ...	71	2	1	Holy Trinity, St. Marylebone (Rev. R. F. Hungen) ...	78	15	0
St. Mary's, Shortlands (Rev. H. F. Wolley) ...	42	7	7	St. Crispin's Vicarage, Bermondsey (Rev. J. Wallace) ...	7	2	0
St. Philip's, Sydenham (Rev. A. E. King) ...	35	0	0	St. Mary's and St. Andrew's, Acton (Rev. F. D. Stungess) ...	38	17	3
Mr. H. Trower ...	21	0	0	All Saints, Westbrook, Margate (J. H. G. Randolph) ...	8	7	3
St. John Baptist, Eltham (Rev. W. J. Sowerby) ...	31	11	3	St. Dunstan-in-the-East (Rev. F. A. P. Shirreff) ...	6	11	10
Trinity Presbyterian Church, Notting-hill ...	35	12	7	Devonshire-road Strict Baptist Chapel, Greenwich (Rev. S. Boorne) ...	7	4	2
Mr. J. J. Randolph (further) ...	25	0	0	Northwood Church, Middlesex (Rev. J. R. Garrett) ...	10	12	9
Major Jones (further) ...	20	0	0	Christ Church, Lower Sydenham (E. H. Francis) ...	16	4	7
Miss Edith Wright ...	35	0	0	St. Michael's, Lower Sydenham (E. H. Francis) ...	5	5	10
Christ Church, Lancaster-gate (Rev. C. J. Ridgeway) ...	1150	16	11	Christ Church, Oxford, Mission, Poplar (Rev. W. A. Carroll) ...	7	5	9
St. John's Presbyterian Church, Kensington ...	120	0	0	West Wickham Church (Rev. H. B. Roberts) ...	31	16	1
St. Luke's, Redcliffe-square (Rev. Evan Hopkins) ...	50	0	0	Alldham Church, Walford, Herts (Rev. Kenneth F. Gibbs) ...	50	0	0
St. Anne's, Wandsworth (Rev. N. Campbell) ...	27	12	5	Hampstead Parish Church (Rev. S. B. Burnaby) ...	58	13	1
St. Thomas's, Regent-street ...	44	0	10	Nutley Lane Church, Reigate (Rev. Ed. J. Baber) ...	16	15	9
New Court Chapel, Tollington-park ...	25	5	9	St. Jude's Vicarage, Bethnal-green (Rev. W. H. Davies) ...	5	17	0

THE AFFILIATED BENEFIT NURSING ASSOCIATIONS.

THESE associations held their second annual conference on Thursday, June 6th, at the residence of Lord Egerton of Tatton, St. James's-square, Dr. Holman being in the chair. Miss Broadwood reported the year's work done through their Office and Registry, 12, Buckingham Palace-road: 68 cottage nurses had been trained, 31 of them at Plaistow; 10 nurses not specially trained for cottage work were permanently placed, and 42 others on job, those specially trained being the most satisfactory. Nine addresses had been delivered, 2771 letters received, and 2925 letters and pamphlets despatched. A year ago 58 associations were working on the Holt-Ockley system started in 1883; now there were 70 stretching from Land's End to John-o'-Groat's House, and others were forming; 53 had affiliated. The question of how far their cottage nurses did, and might, act in maternity cases without the aid of medical men had been raised and investigated. Their medical advisory committee were satisfied that it was not a common practice. While averse to supplying midwives except with the assent of local practitioners, they must aim at, as heretofore, their cottage nurses knowing how to act if the medical man failed to arrive in time.

Dr. Holman congratulated them on the flourishing state of their associations. The object was backed up by political economy, by common humanity, and by Christianity; and because its principles were sound it must prosper, grow, and spread, as the other association with which he was connected had spread beyond the United Kingdom into the Colonies. A central office in London where all could meet was absolutely necessary. He rejoiced that the question of monthly nurses had been discussed. Dr. Buxall and himself had been in the forefront of the fight about midwives. The original opinion was to punish any nurse who attended a labourer without a medical practitioner. He had known countrywomen to suffer terribly from neglect during the hours that it took the husbands to hunt up the relieving officer and then the parish medical practitioner. Was it not better to train cottage nurses to be useful in such cases? Midwifery was a burning question at this moment, and he hoped they would do their best to get the Midwives Registration Bill passed in the House of Lords.

Dr. Robert Buxall said the benefit which these associations confer upon the poorer classes in country districts was immense, and it was with the greatest pleasure that he acted upon their advisory committee. Midwifery and midwives involved a difficult matter to deal with. They might all have ideals as to what should or should not be done, but they must look upon cases from a practical point. Considering the number of lying-in cases throughout the kingdom, the difficulty of obtaining sufficient attendance was very great. There was a very great difference between the duties of a nurse and of a midwife. The nurse was engaged, as a rule, to attend a case under the control of a medical man, but a midwife attends without such direct control. It is much easier for a midwife to recognise difficulties and dangers than for a nurse to do so; midwives are taught to make certain examinations which the nurse is not trained to make. In making such examinations it is possible, quite unwittingly, to do an infinity of mischief; the nurse is not given training to enable her to distinguish, and for that reason it seemed to him scarcely fair to impose upon a nurse these duties. These benefit associations would be in a false position if they allowed nurses to attend cases where neither a midwife nor a medical man was engaged. The medical man may know from experience what some individual nurse is capable of doing, and may leave her to act alone; but *then* he takes the responsibility upon himself. On the other hand, many cases of emergency might arise in which it would be absolutely essential that the nurse should have sufficient knowledge to act alone without competing with the medical practitioner or midwife; and unless the nurse had been taught to deal with such cases grave injury to mother and child might ensue. What would they say if the captain of a ship were incapacitated and no petty officer or seaman were ready to take his place and to do his best to navigate the ship into port?

Mr. J. Bokersteth explained how well the benefit system worked in the Wilton Beacon District of Yorkshire, where they had 23 agricultural parishes and only 3 resident

gentlemen. Their cottage nurses were drawn from the general-servant class of the neighbourhood and were trained at Plaistow, or the City of London Lying-in Hospital, and were prepared to do the work of the cottage when the mother was ill.

The Viscountess Galway and Miss Whitmore-Jones, organising secretary for the south-west of England, bore testimony to the equally satisfactory working of the associations in Oxfordshire, Gloucestershire, and Nottinghamshire.

THE ANNUAL DINNER OF THE ARMY MEDICAL STAFF.

THE annual dinner of the Army Medical Staff was held at the Whitehall Rooms of the Hôtel Métropole, on June 17th, and was in every way a successful function.

The company numbered seventy-five, and included the—
Director-General: Surgeon-Major-General Sir W. A. Mackinnon, K.C.B. (who presided).

Surgeon-Major-Generals: Sir Joseph Fayrer, K.C.S.I., C. H. Giraud, R. Harvey, D.S.O., J. Jameson, E. C. Markey, C.B., H. F. Paterson, J. B. C. Reade, C.B., J. J. Thompson, and J. Warren.

Surgeon-Colonels: O. Codrington, W. G. Don, E. McGrath, W. S. Price, F. B. Scott, C.M.G., W. Sly, H. Veale, and J. Watts.

Brigade-Surgeon-Lieutenant-Colonels: J. A. Anderson, A. L. Browne, J. D. Edge, E. Fairland, W. J. Fawcett, J. Hector, J. G. Leask, C. Mackinnon, W. McWatters, T. R. Mould, J. L. Nutter, W. S. Pratt, A. B. Robinson, W. G. Ross, W. F. Rutledge, W. F. Stevenson, W. Temple, V.C., E. D. Tomlinson, W. J. Wilson, and T. Wright.

Surgeon-Lieutenant-Colonels: J. Costa, J. J. Crean, P. R. Gabbett, W. C. Gasteen, J. J. Greene, E. H. Joynt, G. D. N. Leake, G. H. Le Motte, T. Ligertwood, and K. Smith.

Surgeon-Majors: W. G. A. Bedford, W. A. Carte, H. Grier, R. J. D. Hackett, R. P. Hetherington, A. A. Lyle, W. G. Macpherson, R. Porter, M. R. Ryan, R. J. S. Simpson, C. K. Tyrrell, and G. E. Twiss.

Surgeon-Captains: J. G. Deacon, J. S. Edye, H. P. Elkington, C. E. Fauce, J. Fayrer, H. Hore, J. Moir, M. W. Russell, and M. T. Yarr.

The following guests were present: Mr. Christopher Heath, the President of the Royal College of Surgeons of England; Brigade-Surgeon-Lieutenant-Colonel Hooper, the President of the Indian Medical Board; Mr. E. Hart, Mr. Vesey Holt, and Dr. S. Squire Sprigge.

Sir J. Russell Reynolds, the President of the Royal College of Physicians of London, and Sir J. N. Dick, K.C.B., the Director-General of the Medical Department of the Royal Navy, were unavoidably prevented from attending.

The arrangements for the dinner, which were made by Brigade-Surgeon-Lieutenant-Colonel J. Hector, honorary secretary, A.M.S. Annual Dinner Committee, left nothing to be desired. But more than seventy-five persons should muster on such an occasion, and in particular more of the younger members of the department. Such meetings do much good by cementing cordial relations already existent, leading to the formation of friendships, and displaying the strength of the department; and we would urge upon the younger members of the Army Medical Staff, many of whom must be stationed in immediate proximity to London, the advisability upon future occasions of devoting an evening to enjoying themselves in the company of their fellow officers.

UNITED HOSPITAL SPORTS.

PROBABLY the threatening aspect of the weather in the early part of the day was answerable in a great measure for the smallness of the gathering on Wednesday last, when the twenty-ninth annual meeting of the United Hospitals Athletic Club was held on the London Athletic Club grounds at Stamford Bridge. When the contests commenced, however, at three o'clock the weather looked more hopeful, and the sun shone brightly throughout the progress of the sports. The track was in fine condition.

Mr. H. T. Bell of Guy's, who last year carried off the 100 yards challenge cup for the third time in succession, passed

his laurels to Mr. H. C. Woodyatt, but almost succeeded in regaining them for the High Jump (which he lost last year after two previous victories) by making a dead heat with C. B. Adams of Middlesex. The one-mile and three-mile challenge cups were for the fifth time in succession carried off by Mr. H. A. Munro of Guy's, and Mr. E. N. Scott of the same school was successful in the hammer-throwing contest for the third time. Mr. W. F. Bennett, who represents St. Bartholomew's, succeeded in outdoing his last year's performance with the shot, and in the 120 yards hurdle race Mr. J. Johnston, who held the cup last year for St. Bartholomew's with a record, came in level with Mr. H. N. Coltart of St. George's. The long jump went to St. Mary's after being held for two years by Guy's. Mr. C. E. H. Leggatt succeeded in beating Mr. H. T. Bell. The 220 yards went to University College Hospital, and the quarter mile to St. Mary's, as did also the half-mile, both being won by the same competitor.

100 Yards: H. C. Woodyatt (University), 10 $\frac{1}{2}$ sec. Half Mile: A. G. Butler (St. Mary's), 2 min. 0 $\frac{1}{2}$ sec. Putting the Shot: W. F. Bennett (St. Bartholomew's), 35 ft. 10 in. 120 Yards Hurdle Race: J. Johnston (St. Bartholomew's) and H. N. Coltart (St. George's), dead heat, 16 $\frac{1}{2}$ sec. 220 Yards: H. C. Woodyatt (University), 23 sec. High Jump: H. T. Bell (Guy's) and C. B. Adams (Middlesex), tie, 5 ft. 7 $\frac{1}{2}$ in. Throwing the Hammer: E. N. Scott (Guy's), 85 ft. 11 in. One Mile: H. A. Munro (Guy's), 4 min. 31 $\frac{1}{2}$ sec. Long Jump: C. E. H. Leggatt (St. Mary's), 20 ft. 11 $\frac{1}{2}$ in. Quarter Mile: A. G. Butler (St. Mary's), 59 $\frac{1}{2}$ sec. Three Miles: H. A. Munro (Guy's), 15 min. 29 $\frac{1}{2}$ sec.

A three-mile bicycle race, not included in the contest for the shield, was won by Mr. J. Burke of St. George's, and a 1000 yards handicap, in which Mr. E. C. Bredin made an attempt, though unsuccessfully, to break the record, was won by Mr. E. J. Wilkins with twenty-four yards start.

The championship therefore goes to Guy's Hospital.

The prizes were distributed by the Countess of Egmont, and during the afternoon the London Victoria Military Band gave a selection of music.

Public Health and Poor Law.

LOCAL GOVERNMENT DEPARTMENT.

REPORTS OF INSPECTORS OF THE MEDICAL DEPARTMENT OF THE LOCAL GOVERNMENT BOARD.

Diphtheria at Long Benton, near Tynemouth, by Dr. R. D. SWEETING.—This report raises a number of interesting considerations in connexion with the etiology of diphtheria, although it does not succeed in elucidating many of the problems which the actual outbreak involved. It deals with 77 attacks of diphtheria and 22 deaths on a population of some 10 000; but, as so often happens, there were a number of minor manifestations of throat disease, a number of which probably had the infective qualities of diphtheria. Two attacks, including the first one recognised, were apparently associated with manure nuisances. The first one was rather typical of occurrences such as have been reported by Dr. Thresh and others. A boy who is stated to have been peculiarly liable to sore-throat was in the habit of riding on a manure cart conveying very offensive refuse from Byker, near Newcastle, and locally his illness was attributed to the manurial emanations. As has happened again and again, it was difficult to eliminate all other sources of infection, and the matter must still remain in doubt. One thing, however, was certain—namely, that school operations tended to the spread of the disease. The clerk to the School Board maintained the contrary, and declared that it was the local insanitary conditions that had produced the evil, and he objected to the attitude of the sanitary authority in requiring school closure. But Dr. Sweeting could find no support for his view; no sanitary circumstances could be found to account for the incidence of the disease; on the contrary, modern well-constructed hamlets &c. suffered as much as others, and elsewhere houses that were attacked and houses that remained free from attack in no way differed from a sanitary point of view. And when the influence of school closure and the consequent arrest of aggregations of school children came to be worked out it was found that in two periods of school operations, extending over 191 days, there had been 67 attacks, whereas in two immediately following periods of 61 days of school closure there were only 8 cases; indeed, in one period of 32 days directly after the school had been closed there was only one solitary case, but instantly on reopening 41 cases occurred in the next ensuing 69 days.

Naturally Dr. Sweeting supports the school restrictions imposed by the sanitary authority.

REPORTS OF MEDICAL OFFICERS OF HEALTH.

St. Marylebone Urban Sanitary District.—Mr. Wynter Blyth, in giving in his current annual report a brief *résumé* of the two outbreaks of small-pox which occurred in his district, speaks highly of the value of establishing a local administrative centre during the periods of the outbreaks. The great lesson, however, which these outbreaks have impressed upon him is the necessity for prompt removal to hospital. If, he observes, every case of small-pox were early diagnosed and removed, no spread of the disease would be possible. Unfortunately the first condition is a difficult one to realise, though we imagine that the opportunity of studying small-pox, which the prevalence of the disease in recent years has afforded, will do something to improve matters, as also will the excellent clinical teaching provided at the hospitals of the Metropolitan Asylums Board. Mr. Wynter Blyth also reports that the good influence of vaccination and revaccination was well illustrated in the outbreaks, and the guardians, he tells us, rendered most efficient help in affording facilities for revaccination. The outbreak, he states, was never satisfactorily stamped out, and he thinks that the failure to effect this was due in part to the non-disinfection of certain articles of apparel. Persons with only one suit of clothing were, it appears, in constant attendance upon patients for from twenty-four to forty-eight hours, and owing to their having no change of clothing, and there being no shelter in the district, disinfection &c. could not be performed. Apparently, however, this defect in the St. Marylebone sanitary equipment has now been remedied. Out of 141 cases of enteric fever notified during 1894, 27 were imported, 17 coming from other metropolitan districts, 6 from the provinces, and the remainder from abroad—i.e., from Paris, New York, and even Buenos Ayres. Commenting upon the several agents likely to convey typhoid fever, Mr. Wynter Blyth remarks that, notwithstanding the report of the Royal Commission, the possibility of the Thames water being at times insufficiently filtered, and of the specific organisms being distributed by the water, cannot be denied. On working out, however, the incidence-rate of typhoid fever per 1000 of the population in each metropolitan district during 1894, and apportioning to each district its own water-supply, he observes that the list shows too many anomalies to suggest that any one of the companies was supplying grossly polluted water. The rates, it may be observed, varied from 1.33 in Poplar and St. George-in-the-East, both supplied by the East London Water Company, to 0.47 in Fulham, which is supplied by the West Middlesex and Chelsea Companies. The rates in Lewisham and Greenwich, supplied by the Kent Company, were 0.65 and 1.01 respectively. We trust that Mr. Wynter Blyth will continue these analyses in his future reports, and we would suggest that the monthly rates would be interesting.

Shoreditch Urban Sanitary District.—As we have occasionally drawn attention to "return" cases of scarlet fever, it is only fair that the negative side of the question should be recorded. Dr. Fraser Bryett relates that although there were 487 cases of scarlet fever notified in his district during 1894, and 65 per cent. were treated in fever hospitals, no "return" cases were brought to his notice. This speaks well, Dr. Bryett observes, for the care exercised by the fever hospital authorities. The shelter provided in Branch-place was utilised during the year on sixteen occasions, and fifty persons took advantage of its existence. The public, Dr. Bryett states, show some disinclination to make use of the shelter, but he has not found it impossible, by the exercise of tact, to overcome their objections. Frequent complaints were made during the summer months of 1894 as to the deficiency in the water-supply and the cessation of the constant service, and the Sanitary Committee finally determined to communicate with the County Council with a view of obtaining, under the Metropolitan Water Act, 1871, a constant supply of water. In reporting as to bakehouses Dr. Bryett tells us that out of ninety-three bakehouses in his district fifty-six are underground, twenty-nine above ground, and the remaining eight partly underground. Of those underground 62.5 per cent. were efficiently lighted and ventilated. Insufficient watercloset accommodation is frequently met with in the factories and workshops of Shoreditch. In discussing the question of smoke prevention Dr. Bryett states that the services of a practical engineer have at times been employed

with good results, and he advises that some such person be engaged permanently by the sanitary authority to deal with smoke nuisance. It is certainly true that many sanitary inspectors are not so well versed in the matter of smoke prevention as they might be.

Lerden and Winstree Rural Sanitary District—Dr. J. W. Cook has (as pointed out by him in a letter published in our columns on June 1st) been instrumental in providing this district with a portable fever hospital, designed by himself. It consists of two Radcliffe double tents with boarded floors, each tent containing four beds. There is in addition a bell tent with beds for two nurses, and a large van on four wheels. The van is fitted up as a kitchen and has provision for a hot-water supply. The floor-boards for the tent are carried in a separate waggon, but apart from these everything appertaining to the hospital is stored in the van. The whole hospital can be transferred to any part of the district and in less than two hours can be erected and made ready for the reception of patients.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns 6861 births and 3130 deaths were registered during the week ending June 15th. The annual rate of mortality in these towns, which had declined in the five preceding weeks from 17.7 to 15.5 per 1000, further fell last week to 15.4. The lowest rates in these towns were 10.5 in Burnley, 10.7 in Portsmouth, 10.9 in Croydon, 11.4 in Sunderland, and 11.7 in Cardiff; the highest rates were 19.2 in Blackburn, 20.5 in Plymouth and in Salford, 21.3 in Manchester, 23.6 in Bolton, and 23.8 in Liverpool. The 3130 deaths included 399 which were referred to the principal zymotic diseases, against 349 and 294 in the two preceding weeks; of these, 133 resulted from measles, 77 from diarrhoea, 73 from diphtheria, 60 from whooping-cough, 28 from scarlet fever, 23 from "fever" (principally enteric), and 5 from small-pox. No fatal case of any of these diseases occurred last week in Sunderland; in the other towns they caused the lowest death-rates in Bradford, Portsmouth, Croydon, and Gateshead, and the highest rates in Cardiff, Liverpool, Manchester, West Ham, and Plymouth. The greatest mortality from measles occurred in Liverpool, Bolton, Manchester, Plymouth, and West Ham; from whooping-cough in Birkenhead and in Huddersfield; from "fever" in Norwich; and from diarrhoea in Plymouth and Blackburn. The mortality from scarlet fever showed no marked excess in any of the thirty-three large towns. The 73 deaths from diphtheria included 45 in London, 6 in Liverpool, 4 in Birmingham, and 3 each in West Ham, Manchester, and Hull. Three fatal cases of small-pox were registered in Derby, 1 in London, and 1 in Oldham, but not one in any other of the thirty-three towns. There were 19 cases of small-pox under treatment in the Metropolitan Asylum Hospitals and in the Highgate Small-pox Hospital on Saturday last, the 15th inst., against 29, 22, and 23 at the end of the three preceding weeks; 2 new cases were admitted during the week, against 7, 1, and 5 in the three preceding weeks. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 1637, against 1503, 1524, and 1589 on the three preceding Saturdays; 199 new cases were admitted during the week, against 214, 187, and 179 in the three preceding weeks. The deaths referred to diseases of the respiratory organs in London, which had been 193 and 163 in the two preceding weeks, further declined to 152 last week, and were 88 below the corrected average. The causes of 54, or 1.7 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Portsmouth, Cardiff, Bradford, Leeds, Oldham, and in twelve other smaller towns; the largest proportions of uncertified deaths were recorded in Bristol, Birmingham, Leicester, Liverpool, and Hull.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had been 21.4 and 19.7 per 1000 in the two preceding weeks, further declined to 17.1 during the week ending June 15th, but was 1.7 per 1000 above the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 14.2 in

Leith and 15.5 in Aberdeen to 18.4 in Greenock and 30.9 in Perth. The 492 deaths in these towns included 25 which were referred to diarrhoea, 14 to measles, 12 to whooping-cough, 3 to scarlet fever, 3 to diphtheria, 1 to "fever," and not one to small-pox. In all, 58 deaths resulted from these principal zymotic diseases, against 60 and 57 in the two preceding weeks. These 58 deaths were equal to an annual rate of 2.0 per 1000, which corresponded with the mean rate last week from the same diseases in the thirty-three large English towns. The 25 fatal cases of diarrhoea corresponded with the number recorded in the preceding week, and included 11 in Glasgow and 6 in Dundee. The deaths referred to measles, which had been 12 in each of the two preceding weeks, were 14 last week, of which 5 occurred in Glasgow and 4 in Edinburgh. The fatal cases of whooping-cough, which had been 17 and 11 in the two preceding weeks, were 12 last week, and included 6 in Glasgow, 2 in Edinburgh, and 2 in Aberdeen. The 3 deaths from scarlet fever were within one of the number in the preceding week, and included 2 in Glasgow. The fatal cases of diphtheria, which had been 3, 8, and 1 in the three preceding weeks, rose again to 3 last week, of which 2 occurred in Edinburgh. The deaths referred to diseases of the respiratory organs in these towns, which had been 118 and 112 in the two preceding weeks, further declined to 87 last week, and were slightly below the number in the corresponding week of last year. The causes of 39, or nearly 8 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had declined in the three preceding weeks from 28.5 to 22.1 per 1000, rose again to 23.1 during the week ending June 15th. During the past eleven weeks of the current quarter the death-rate in the city has averaged 28.4 per 1000, the rate during the same period being 16.9 in London and 18.9 in Edinburgh. The 155 deaths registered in Dublin during the week under notice showed an increase of 7 upon the number in the preceding week, and included 8 which were referred to the principal zymotic diseases, against numbers increasing from 5 to 11 in the four preceding weeks; of these, 4 resulted from "fever," 3 from whooping-cough, 1 from diphtheria, and not one either from small-pox, measles, scarlet fever, or diarrhoea. These 8 deaths were equal to an annual rate of 1.2 per 1000, the zymotic death-rate during the same period being 2.1 in London and 1.9 in Edinburgh. The deaths referred to different forms of "fever," which had been 1 and 2 in the two preceding weeks, further rose to 4 last week, a higher number than in any week since the end of March last. The 3 fatal cases of whooping-cough also showed a further increase upon the numbers recorded in recent weeks. The 155 deaths registered in Dublin last week included 19 of infants under one year of age, and 26 of persons aged upwards of sixty years; the deaths both of infants and of elderly persons showed a further decline from the numbers recorded in recent weeks. Five inquest cases and 3 deaths from violence were registered; and 55, or more than a third, of the deaths occurred in public institutions. The causes of 10, or more than 6 per cent., of the deaths in the city last week were not certified.

THE SERVICES.

MOVEMENTS OF THE MEDICAL STAFF.

SURGEON-CAPTAIN DODD has been transferred from Woolwich to Aldershot and appointed Assistant Instructor at the Depot of the Medical Staff Corps. Surgeon-Captain Gray has been posted to Dublin on return from foreign service. The following officers have arrived in England on leave of absence: Surgeon-Lieutenant-Colonel Edge and Surgeon-Captain Copeland from India, and Surgeon-Captain Rowan from Malta.

INDIA AND THE INDIAN MEDICAL SERVICES.

The following appointments are announced:—Surgeon-Major H. C. Hudson, Bengal Establishment, to officiate as Medical Storekeeper, Meer Meer, until further orders; Surgeon-Lieutenant-Colonel W. O'Hara to be District Medical and Sanitary Officer, Trichinopoly; Surgeon-Lieutenant-Colonel J. A. Laing, to be District Medical and Sanitary Officer and Superintendent of Gaol, Bellary; Surgeon-Lieutenant-

Colonel W. G. King to be Sanitary Commissioner, Madras; Surgeon-Lieutenant W. Young (Bengal), whose services have been placed temporarily at the disposal of this Government by the Government of India, Home Department, to officiate as Civil Surgeon, 2nd class, and to be posted to the Budaun District; the services of Surgeon-Captain H. W. Elphick (Bengal) are placed permanently at the disposal of the Government of the North-West Provinces and Oudh; the services of Surgeon-Major R. R. H. Whitwell are placed at the disposal of the Government of Bengal; Surgeon-Lieutenant Evans has been transferred from general duty, Deesa, to general duty, Mhow District; Brigade-Surgeon-Lieutenant-Colonel Patrick Richard Martin, Madras, retires from the service.

NAVAL MEDICAL SERVICE.

The following appointments are announced:—Deputy Inspector General Alexander Turnbull to Chatham Hospital. Surgeons: Morris C. Langford to the *Orlando*; Alexander Maclean to the *Pembroke*; John A. L. Campbell to the *Sharpshooter*; E. C. Cridland to the *Vivid* (additional); Edward Cuffey to the *Victory*; and Alfred H. Jeremy to the *Itambler*.

VOLUNTEER CORPS.

Artillery: 1st Banff: Surgeon-Lieutenant W. L. Stewart, M.D., to be Surgeon-Captain. *Rifle*: 2nd Volunteer Battalion the Queen's (Royal West Surrey Regiment): Surgeon-Captain H. Stone resigns his commission. 2nd Volunteer Battalion the Prince Albert's (Somersetshire Light Infantry): Surgeon-Lieutenant-Colonel E. Liddon, M.D., resigns his commission; also is permitted to retain his rank and to continue to wear the uniform of the Battalion on his retirement. 3rd Glamorgan: The under-mentioned gentlemen to be Surgeon-Lieutenants: Joseph Edward James Soden and Arthur Lloyd Jones. 1st Nottinghamshire (Robin Hood): Surgeon-Major J. O'Connell Hynes to be Surgeon-Lieutenant-Colonel.

GENERAL SIR E. B. HAMLEY'S LIFE.

The second volume of the "Life of General Sir E. B. Hamley" contains much information which—altogether apart from the unhappy circumstances that led to his sense of grievance and disappointment—will be read with interest by those who took part in the Egyptian campaign of 1882. General Hamley, in his official report to the chief of the staff on the second division at the battle of Tel-el-Kebir, specially notes, for example, the gallantry of Brigade-Surgeon Manley, V.C., who, he says, remained always in the hottest fire, led on stray parties of men, and was of the greatest service to his general at a moment when his staff was dismounted or dispersed, in helping to get his horse over the ditch and parapet of the main entrenchment under a heavy fire. The references, moreover, to the extremely dirty and insanitary condition of the buildings and camping grounds which the troops were, for military reasons, compelled to occupy, to their exposure and to the prevalence of heavy dews at night, bear out the correctness of the views that were expressed at the inquiry which subsequently took place in this country, and go a long way to account for the sickness that prevailed in Egypt in the expeditionary army of occupation after the fighting was over.

THE VOLUNTEER AMBULANCE CHALLENGE SHIELD.

The Volunteer Ambulance Challenge Shield was competed for on Saturday last at Wellington Barracks. Surgeon-Major Grier, A.M.S., Surgeon-Major Carte, A.M.S., Surgeon-Captain Jackson, A.M.S., Surgeon-Major Collingridge (Militia Medical Service), Surgeon-Major Hurst (Northumberland Volunteers), and Surgeon-Captains Squires and O'Callaghan (Volunteer Medical Staff Corps) were the judges who awarded the shield to the 1st Volunteer Battalion Highland Light Infantry, a Glasgow corps, with 274 marks out of the possible 300. Badges were given to the four men composing the team, and also to those of the 2nd Volunteer Battalion Royal Fusiliers, 252 marks; and the Civil Service, 240. The 1st Wilts, 1st Bucks, and 2nd Volunteer Battalion Liverpool followed next in order of merit. At the conclusion of the proceedings Surgeon-Major Grier complimented the teams on the excellence of their work.

MEDICAL MEN AND SERVICE CLUBS.

The *Court Journal* makes the following comment, which we think worthy of quotation, in reference to the recent elections at a popular Service club:—"If it is true that Service clubs are just now showing a feeling against electing

candidates belonging to the medical branch of the Service, it is a fact to be regretted. Combatant officers, if they can dispense with the presence of medical men at their clubs, cannot do so in action, when they themselves may be black-balled in a more deadly manner; this they might remember."

DEATHS IN THE SERVICES.

We regret to have to announce the deaths of the following officers:—

Surgeon-Major Horatio Scott (retired), A.M.S., at Basingstoke, Hants, in his sixty-second year. The deceased officer entered the Army in 1858 and retired in 1888.

Surgeon-Captain George Nelis, A.M.S., at Bombay, on the 9th inst., in his thirty-ninth year.

Surgeon-General R. Bowen (retired), A.M.S., at Eastfield, Weston-super-Mare, on the 7th inst. aged seventy-seven years.

On the 17th inst. fifty-five patients were admitted at the Royal Victoria Hospital, Netley, having arrived at Portsmouth by s.s. *Marcotus*, which left Malta on June 7th.

Correspondence.

"Audi alteram partem."

"THE MIDWIVES REGISTRATION BILL."

To the Editors of THE LANCET.

SIRS,—As master of the Rotunda Hospital, which is one of the largest training schools for midwives in this country, I have been so often asked for my opinion upon the Midwives Act that I think it advisable to publish my views through your influential journal. I consider that it is a matter of urgent importance that midwives should be registered; but I consider the definition of a midwife as "a woman who undertakes to attend cases of natural labour without the direct supervision of a medical practitioner" as most objectionable. It places those women who prefer to attend without medical supervision in a superior position to those, often better informed, who prefer to attend if possible with a practitioner, and throws the midwife into antagonism with the medical profession, which cannot fail to do harm; and in this the Midwives Institute are in the wrong; since they wish to accentuate the difference between a midwife and a monthly nurse. In a large proportion of cases a monthly nurse must act as a midwife, and should therefore be a trained midwife. In abnormal cases, on the other hand, a midwife should send for a practitioner and should, acting as a nurse, give him assistance. Many midwives, however, will not do this, but, on the contrary, when the practitioner arrives the midwife departs. In Ireland a midwife is also a nurse; our certificates state that "— has been trained as a nurse-tender" (or midwife), and the result is that in this country there is little or no friction between medical practitioners and midwives. I object, therefore, to this Bill as giving a legal position and prestige to women who prefer to act without medical supervision and does not sufficiently provide against their treating cases other than normal; because it centralises all authority in London, which is unfair to other teaching centres; and because, being limited to England and Wales, it would prevent our midwives practising in those countries, which would practically extinguish Dublin as a training school for English midwives.

I am, Sirs, yours faithfully,

W. J. SMYLY, M.D.

Rotunda Hospital, Dublin, June 18th, 1895.

To the Editors of THE LANCET.

SIRS,—May I in a few words point out one or two of the impossible conditions embraced in the Draught Scheme published in your issue of June 8th by Dr. Lovell Drage. It is all based on the second clause: "If the women are unable to obtain proper assistance," &c. With a Poor-law system which embraces all parts of the country, it is difficult to see how the District Board, composed as it is of the guardians of the poor who have the carrying out of the Poor-law, could be got to declare that the women in a part of their district were unable to obtain proper assistance, as it would be tantamount to passing a vote of censure against themselves. Even if this difficulty were got over, the remedy proposed is neither more nor less than the wholesale pauperisation of the district.

From the amount of officialism to be expended on each stage of the inquiry, it is evident that Dr. Drage's scheme would defeat rather than assist the end it appears to have in view.

I am, Sirs, yours faithfully,

F. ROWLAND HUMPHREYS.

Fellows-road, South Hampstead, N.W., June 11th, 1895.

THE ROYAL COLLEGE OF SURGEONS IN IRELAND AND THE APOTHECARIES' HALL OF IRELAND.

To the Editors of THE LANCET.

SIRS,—As some misapprehension seems to exist regarding the report of the visitors to the examinations of the Conjoint Board of the Royal College of Surgeons and the Apothecaries' Hall of Ireland, it is necessary shortly to state the facts. Under the Medical Act of 1836 it became necessary to form a union between various licensing bodies for the purposes of examination. Such a junction was effected and still exists between the Royal College of Surgeons in Ireland and the Royal College of Physicians. The Apothecaries' Hall then established its right to give a diploma which could be registered, and to do this it was necessary that there should be an examination in surgery. That body had been left out of the combination of the College of Physicians and the College of Surgeons, and in accordance with its right it applied to the General Medical Council for leave to appoint examiners in surgery, and permission was granted in May, 1837. It was, however, deemed inadvisable that an independent licensing body of this kind should continue in Ireland, and after negotiations the College of Surgeons entered into a conjunction with the Apothecaries' Hall to examine candidates apart from the union with the College of Physicians. Examiners were appointed, partly by the College of Surgeons and partly by the Apothecaries' Hall; but upon reports made by the visitors of the General Medical Council the Council of the College of Surgeons decided by vote on June 22nd, 1894, to terminate the arrangement at the close of one year. It was, however, agreed that all candidates who had passed part of the examinations should have their rights preserved and should be examined so long as they presented themselves.

The examinations have been very closely inspected and freely reported upon. The last report of the visitors (April and May, 1895) describes the first professional examination as "a good and satisfactory test"; in the second the examination in anatomy and materia medica and pharmacy as "commendable"; and of the third it declares that "no exception could be taken to any part of this examination." Of the final examination the visitor and inspector report an "improvement generally." At this examination the examiners in medicine are appointed by the Apothecaries' Hall, and in surgery by the College of Surgeons. In all the other subjects, save medicine, the visitors state that the examination was "sufficient," and of the examination in medicine it is right to say that the visitors differ from the examiners in one point only, and that they declare that the "examination was a most careful one, and, we believe, was conscientiously conducted." It was upon this report that the Medical Council agreed to bring this conjoint scheme before the Privy Council as insufficient. What we desire to show is that the work of the College of Surgeons in this connexion has been properly carried out and to make it known that the partnership is on the eve of dissolution. There is no examination in the world with which faults of different kinds may not be found by so many different visitors. For many years the examinations of this College, as of all others in the United Kingdom, have been reported on, and we have received frequent commendation. The College endeavours to maintain a high standard; in certain senses its examinations are in advance of those of other countries, and in this last report we have again obtained the approval of the visitors.

We ought, perhaps, again to point out that the union between the College of Physicians and the College of Surgeons continues as before, and that the examinations have been declared to be, in the words of the Act, "sufficient."

W. THORNLEY STOKER President.

WILLIAM THOMSON, Vice-President.

ROBERT H. WOODS, Sec. of Council.

Royal College of Surgeons in Ireland, Dublin,
June 11th, 1895.

VISION IN ELEMENTARY SCHOOLS: A REQUEST.

To the Editors of THE LANCET.

SIRS—Will you permit me to say through your columns that I have undertaken, in conjunction with a committee of the Education Department, to investigate the state of vision among the children in elementary schools, and that I shall be very glad to obtain the help of competent volunteers in carrying out this undertaking? Any gentlemen accustomed to estimate refraction, and able to spare a couple of afternoon hours on stated days, will much oblige by communicating with me at 31, Harley-street, W. I propose to ascertain the percentage of children with subnormal vision and the cause to which in each case the subnormality is to be ascribed. I should, perhaps, add that my own work in the matter will be unpaid, and that I am consequently unable to offer payment to those who may be good enough to assist me.

I am, Sirs, your obedient servant,

Harley-street, W., June 18th, 1895. R. BRUDENELL CARTER.

THE REMUNERATION OF MEDICAL OFFICERS TO PROVIDENT ASSOCIATIONS, CLUBS, ETC.

To the Editors of THE LANCET.

SIRS—The paper of Mr. F. R. Humphreys, read before the Hunterian Society, on the Necessity for a Central Organisation in the Medical Profession, and the publication in THE LANCET of June 8th of the Hospital Sunday Committee, render the above subject peculiarly interesting just now. I hope, therefore, you can find room for what must, from the nature of the subject, be a long letter. Some years ago you did me the honour to publish a letter regarding the general income of the profession, which led to such a long discussion as proved this to be a burning question. For years past the number of qualifications granted has exceeded the retirements from the medical profession by some 600 a year. This means in a single generation an increase of 18,000 in the number of medical men. It is no wonder, therefore, that medical practitioners are tempted to undersell one another. According to Mr. Neison's statistics of the sickness experienced in the Manchester Unity of Oddfellows, one may expect in patients between the ages of twenty-one and sixty-five an average of one month's sickness per head per annum, which, I think, may be taken as equivalent to fifteen visits. As the present payments range from 3s. 6d. to 6s. a year (most usually 4s. or 4s. 4d.) we may consider the scale of payment to medical officers of provident dispensaries, friendly societies, &c., as about 3d. a visit, including medicine. I think parochial medical men get less even than this, but it is difficult to compute. It seems to me that no contribution is worthy of the name of "provident," in which the scale of pay is so inadequate that it would be impossible for a man devoting his whole time to the work to make the poorest living commensurate with his class of life. Let us see how 3d. a visit works out. We will even assume that the present scale of payments would allow of 1d. for each consultation at the surgery as well as 3d. for each visit at the patient's house. We will assume that poor people live close together and can be seen at the rate four visits (or twelve consultations) an hour. It is only in towns that such an assumption would hold good. As eight hours is considered a working man's day, we will take eight hours as a just day's work for a medical man of which six are spent in visiting and midwifery and two in home consultations and dispensing. Thus we have—

Six hours, at four visits per hour at 3d. each	6 0
Two hours, at twelve consultations per hour at 1d. each	2 0—8 0
Deduct for expenses—	
Use of furnished waiting-room and surgery, with fires, lights, and attendance, say	1 6
Thirty bottles of medicine at 1d. each (cost price)...	2 6—4 0
Nett cash	4 0 a day.
Equal to...	24 0 per week.

Twenty-four shillings a week is not the pay of a skilled mechanic, and you will grant that I have estimated the working expenses at too low a figure. Nor have I reckoned anything for interest on or recovery of capital sunk in obtaining

a qualification. Nor do I believe that any man could long stand the strain of six hours visiting a day on foot besides the other work; anyway, no skilled mechanic has anything like it. Even at 1s. a visit and 6d. a consultation, if a medical man drove on his rounds you will find that at eight hours a day it would not be likely that he would make £200 a year. Even the clergy, admittedly badly paid, do better than this. No, Sirs, if the poor cannot pay more than 4s. a year let it be called *charity* and not *providence*. Add the work done gratis at the hospitals and elsewhere, and how many millions a year do the medical profession contribute to the charities of England?

Would it not be possible for the profession to form an association among themselves that really would charge "provident" rates? Let us suppose that a shilling a month was the minimum. Let any medical man or chemist belong to the association who was on the Register. Let there be a fixed tariff for dispensing, and let that be done by chemists, as it should, and let the balance be divided amongst the medical men according to the number of patients entered on their list. Let there be one simple rule, that no medical man was eligible to belong to this association who accepted less payment from any club or provident society that did not publicly profess to be a charity. At present the holders of these appointments are often the best men in the neighbourhood, but let them once occupy the invidious position of underselling their brethren and they would either resign or insist on the public announcement that the Association they served was a charity entitled to demand a rigid scrutiny of the means of all applicants. The present tests are usually farces. Poor people have little or no idea that they are getting the services of medical men for anything less than the market value and would be indignant if charged with the "sweating" practices so loudly denounced by their own champions in Parliament and elsewhere. No government dare give out a contract without stringent regulations to protect the workman against sweating middlemen, and yet there is not a medical parochial appointment in England which could not justly be described as "sweated."

I am, Sirs, yours faithfully,
E. PAGET TRUBSTAN, M.D.

THE VAPOUR OF OPIUM AND OTHER VAPOURS OF THE PHARMACOPŒIA.

To the Editors of THE LANCET.

SIRS,—In treating a case of the ordinary insomnia of influenza I found recently some good results from the inhalation of the vapour of opium. In one case especially, after four nights of sleeplessness, twelve hours followed the inhalation of the vapour obtained by the combustion of one and a half grains of opium. It seems, according to the valuable papers of Dr. Reginald Thompson in the *Practitioner* (1878 1879), that the inhalation of opium is of great value in the relief of such cases as are admitted into the Brompton Hospital; and if this be so, there are other classes of cases which might receive benefit from the administration of opium in the form of vapour. It would seem possible to make a more rational use of opium as vapour than is done by the Chinese, and the question, I think, is worth our consideration.

It is desirable that some great improvements should be made in the "vapores" of the Pharmacopœia. There is no doubt but that the use of some medicinal agents in the form of "vapores" may be of great benefit in a certain class of cases; but to effect good it is necessary to study carefully the scientific principles on which evaporation depends and how they are to be put into practice. The "vapores" are the most curious evidence of ignorance that can be quoted from the Pharmacopœia.

I am, Sirs, yours faithfully,
West Kensington, June 14th, 1895. ROBERT LEE.

"ENTERIC FEVER AMONG EUROPEAN TROOPS SERVING IN INDIA."

To the Editors of THE LANCET.

SIRS,—In your issue of May 18th Brigade-Surgeon-Lieutenant-Colonel Climo, in his article on "Enteric Fever among European Troops Serving in India," states: "The explanation of the comparative immunity of native troops is that in childhood natives have passed through conditions arising from exposure to the enteric poison which, in after-life, render them exempt from the disease." In this state-

ment appears to me to lie the explanation of the entire matter. As in India the insanitary environments procure immunity for the race born and bred therein, so some few decades ago the insanitary condition of England likewise procured immunity for her sons and consequent freedom from enteric fever when they were called upon to serve abroad. The vast strides in sanitation made in England within the last twenty or thirty years have resulted in the production of a race that, unless possessed of natural immunity, as many individuals no doubt are, is certain to suffer severely on arrival in insanitary countries such as India or Egypt, where enteric fever is endemic.

Further, the more perfect sanitation becomes at home, the greater the prevalence of enteric fever we must anticipate abroad, until such time as the sanitary conditions abroad equal those at home. The above appears to me to be a more reasonable explanation of the "Scourge of India" than the abolition of the regimental surgeon, advanced by Dr. Climo; or the youth and short service of the soldier of the present day, generally accepted by other writers.

I am, Sirs, yours faithfully,

W. L. CHESTER, M.B.,
Cairo, May 22th, 1895. Surgeon-Lieutenant-Colonel, A.M.S.

"ADENOID GROWTHS IN CHILDREN."

To the Editors of THE LANCET.

SIRS,—The interesting communication of Dr. Eustace Smith on laryngeal spasm associated with post-nasal growths in infants, and the subsequent correspondence, encourage me to send you the outlines of a case which came under my notice about two years ago. The patient was a well-developed boy aged seven months. The peculiar loud crowing noise had been first observed soon after birth, and was most marked during sleep. It seemed to increase up to the time at which I was asked to see the patient. I found adenoid vegetations were present and caused incomplete nasal obstruction. I removed the adenoids with a Gottstein's curette. The operation removed what nasal obstruction was present before the operation, but it appeared to have no effect on the laryngeal spasm, which continued for eight months longer; at the end of this time the crowing gradually disappeared.—I am, Sirs, yours truly,

J. JACKSON CLARKE.

Old Cavendish-street, W., June 17th, 1895.

To the Editors of THE LANCET.

SIRS,—My attention has been drawn to an article by Dr. Eustace Smith on "Adenoid Growths in Children" as a cause of, amongst other conditions, laryngismus and other spasmodic laryngeal affections, and he has stated that such cases used to puzzle him greatly. Permit me to remark that in the first edition of "The Throat and its Diseases," published in May, 1878 I drew attention to the subject of adenoids, with pictorial illustration of a case operated on in October, 1877, and also to the importance of enlarged tonsils as a cause of nervous laryngeal cough.

In the third edition, dated May, 1890, p. 518 (and previously in the *British Medical Journal*, Feb. 15th, 1890), I insisted on "the primary importance of naso-pharyngeal glandular hypertrophy, in other words, adenoid growths in the vault of the pharynx," as a factor "not only of laryngismus, but also of tetany and convulsions, which are both exaggerated examples of the same disease." I have gone even further, and in fact, *pace* Dr. McBride, have long held that it would be difficult to name any inflammatory or reflex disease of the respiratory passages in children in which recognition of nasal obstruction was not a necessary step to a complete diagnosis, and removal of the same the most rational and effectual method of treatment. These views, not only with regard to laryngismus, but almost every other disease mentioned by Dr. Eustace Smith, have been urged by me with enthusiasm and persistence for so many years, both in my systematic works and at medical societies and in current medical literature, that I may be pardoned for expressing surprise that they only first attracted Dr. Eustace Smith's attention so recently as October, 1891.

I am, Sirs, yours faithfully,

Mansfield-street, W., June 11th, 1895. LENNOX BROWNE.

"* We are strongly of opinion that, as a general rule, claims to priority in the detection of diseases or their

symptoms are to be deprecated among members of the profession, if only for the reason that to draw attention to a subject is not necessarily to recognise its importance. We recommend, however, to the perusal of Mr. Lennox Browne our obituary notice of Dr. Hans Wilhelm Meyer (p. 1613), and the substantial claims that it contains for the recognition of the services of that learned physician and certain of his *confrères*.—ED. L.

"THE SECRETARY OF STATE, THE SOCIETY OF MEMBERS, AND THE COUNCIL OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND."

To the Editors of THE LANCET.

SIRS,—In your otherwise correct annotation on the subject of the intervention of this society in connexion with the amendment of By-law 16, you have omitted to mention that the Secretary of State agreed with our main contention, which was that the Council (as at present constituted) is not fitted to be the sole and uncontrolled judge as to what is "infamous conduct" on the part of a member. Under the by-law as proposed, it was pointed out by Mr. Asquith that "the only question which could be decided by a court of law would be whether, in 'the opinion of the Council,' a member had offended against the terms of the by-law, thus leaving the action of the Council wholly uncontrolled." Under the by-law, as amended by the Secretary of State, the Council has full powers to deal with offenders, subject to the salutary control of the law-courts.

I am, Sirs, yours faithfully,

Southfields, S.W., June 17th, 1895.

W. G. DICKINSON.

THE SUPPORT OF HOSPITALS AND THE ABUSE OF THEIR SERVICES.

To the Editors of THE LANCET.

SIRS,—As a medical man having some knowledge of the immense abuse of the out-patient department of hospitals and of the disastrous effect this has upon my own profession, I felt great difficulty in my capacity of churchwarden in giving my sanction to devoting the offertories on "Hospital Sunday" to the fund which goes by that name. It does not appear to me to be right to give money dedicated to God's service to a fund which is divided up amongst a number of institutions who admittedly make little or no attempt to confine the expenditure of the donations to the purpose for which they were given; while, on the other hand, the money is partly expended in carrying on a grossly unfair competition with a profession which is noted for its charitable acts. My vicar had, I found, made arrangements long since, in accordance with the custom of previous years, by which the offertories of Hospital Sunday were to be given to the Fund, so that I did not interfere with them on this occasion; but I do feel that since you issue a Supplement showing the needs of the hospitals, it is not unreasonable to ask you also to publish a statement showing the attempts which are being made by the hospitals and dispensaries benefited by this Fund to devote money given to them to charitable purposes—i.e., entirely to the objects for which the money is given—and so defending it from abuse.

I am, Sirs, yours faithfully,

June 10th, 1895.

PEOPLE'S WARDEN.

THE ELECTION OF MEDICAL OFFICER TO THE LAMBETH INFIRMARY.

To the Editors of THE LANCET.

SIRS,—In your issue of June 1st there was an advertisement for the post of medical officer to the Lambeth Infirmary. The chief points in it were—the candidate "must possess the medical and surgical qualifications prescribed by the orders of the Local Government Board"; "he will be required during term to give lectures to the probationers under training at the infirmary"; and "the entire management of the infirmary, whether medical or otherwise, is placed under the control of the medical officer, rendering it essential that he should be possessed of good administrative capacity as

well as professional skill and experience." These are over fifty candidates, myself amongst the number. I have just heard that the finance committee, in whose hands is placed the selection of four or five candidates to go before the full board, last night passed a resolution, with one or two dissentients, that all those candidates who did not possess an M.B., M.D., or F.R.C.S. degree be struck out. Now, Sirs, I think a proceeding of this kind ought not to be kept a secret. It is most unfair to all those candidates who have not got these degrees, and who thus wasted their time and money in sending in their applications. It may act (and probably will) in a manner most prejudicial to the interests of the board itself, and also the ratepayers, because the man most fitted for the post may be amongst those struck out, for it by no means follows that because a medical man has an M.D. degree therefore he is capable of taking charge of the Lambeth Infirmary, which is really a hospital with over 600 beds. It is also most stultifying to the board itself, for if the members had originally intended to limit the candidates in this particular way they would have said so in their advertisement. Why, then, should this committee override the board? The committee also fixed the minimum age at twenty-eight. I hope you will not think that I write this as a disappointed candidate. Personally, it makes very little difference to me; but I think that such peculiar methods of selection ought to be exposed, for if this is taken as a precedent it must of necessity debar many efficient men from applying.—I enclose my card and am, Sirs, yours obediently,

June 18th, 1895.

M.R.C.S., &c.

P.S.—The election is fixed for the 26th inst.

"THE BOYLE LECTURE AT OXFORD."

To the Editors of THE LANCET.

SIRS,—I am very much obliged to you for indicating where I could find Professor Crum Brown's lecture fully reported. I have now read it more than once with considerable interest, but also, I am bound to add, with some perplexity. If the distinguished lecturer will pardon my saying so, his diction is not always perfectly lucid. Here, for example, is a passage which for the life of me I cannot construe into either rhyme or reason. "If we call the line along which we look during the pause between two jerks a glance-line, we may describe the whole phenomenon by saying that the glance-lines are fixed relatively to fixed external objects, whether the head is rotated or not. This, of course, means that during a pause the eyes are rotated relatively to the head about the axis on which the head is really rotated, in the opposite sense and through the same angle as the head." Now what on earth do these words mean? They are all simple, commonplace expressions, employed apparently in consonance with the ordinary rules of grammar, but the more I pore over the passage the greater grows my bewilderment. To the Professor, with the context in his mind, the meaning doubtless is as plain as a pikestaff, but I freely confess I am quite unable to fathom it. After such an admission of incompetence I am almost afraid to insist on the two objections raised in my former letter, and yet one of them, at all events, seems to me in my ignorance to be well founded. If, however, I am to be hung (as seems probable) I may as well have my sheep—provided, of course, I am not thereby seeking to trespass too far upon your kindness and space.

As regards my first objection I find that Professor Crum Brown does not assert that "when the head is moved rapidly in one direction the eyes have to move to a corresponding extent." On the contrary, he talks of fixing the eyes on a point and keeping them so fixed while rotating the head. He is well aware of the power we all possess of moving our heads while steadfastly regarding a fixed object, and yet he commits himself without limitations to the following statement: "What has been said seems to show that our immediate sense that the earth and what we call fixed objects on it are fixed is a consequence of the way in which we move our eyes, and, in particular, of the way in which, by a suitable movement of the eyeballs, we involuntarily and unconsciously compensate movements of the head, voluntary or involuntary, conscious or unconscious."

As regards my second objection I have only to add that in my humble opinion there is nothing in the lecture to diminish its validity. According to Professor Crum Brown the force controlling the compensatory movements of the eyes is

purely mechanical; it is consequently impossible to reconcile his theory with obvious facts.

I am, Sirs, yours faithfully,

June 17th, 1895.

SURDUS.

LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

The Shahzada's Visit to the City.

THE visit of the Afghan Prince was in all respects most successful. It comprised part of the afternoon of Tuesday, the 11th, the whole of Wednesday, the 12th, and a great part of Thursday, the 13th inst. On the Wednesday he had an admirable opportunity of seeing the better and the worse side of Liverpool, the procession being through a principal thoroughfare of Toxteth Park which was thronged with the inhabitants of the worst streets in Liverpool. A short drive took the Prince to a sight much more agreeable, Sefton and Prince's Park, with their many noble mansions. The Prince had previously travelled by the Over-head Railway, so called because it passes at a high level along the line of docks over the street traffic, the motor power being electricity. The Prince was so much interested in it that he repeated his visit to this railway next day. In addition to an address at St. George's Hall and a luncheon at the town hall, he had an opportunity of seeing the river Mersey to great advantage, and also of witnessing the novel sight of an Atlantic liner moored by the landing stage. Liverpool is determined not to be surpassed in facilities of transit by Southampton or any other port, and it may interest all American visitors professional and lay, as well as all visitors from England to America, to learn that they can now pass through Liverpool with every comfort and without delay by means of the new riverside railway station, all the discomforts of tenders, porters, cabs, &c. having been relegated to the past. The Mersey is remarkably free from stench, though at a certain state of the tide and in certain parts of the river one is occasionally reminded that it is made a deposit for sewage. Perhaps the day is not very far distant when the deposit of sewage in a tidal river will be regarded as even more dangerous than intra-mural burial.

Deaths of Prominent Citizens.

Within the last few days several prominent citizens have passed away, among others being Mr. R. Ellis, clerk to the city magistrates, and Mr. G. J. Atkinson, the town clerk. Both these gentlemen had been brought in contact with many members of the medical profession, each and all of whom could testify to the value of these two public servants. Each in his capacity was a model of what a public official should be, always at hands, always ready to give information in his department, and always respectful, courteous, and obliging.

June 18th.

NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

Site for a New Infirmary, Newcastle-upon-Tyne.

THE governors of the Royal Infirmary, having failed to induce the corporation to grant them a site on the Leazes, sent a few days ago a deputation to the town council asking for an extension of the present site. The ground upon which the infirmary was originally built was given by the corporation, and it is felt that what the corporation did some hundred and fifty years ago they should be able and willing to do again. If a portion of the ground now occupied as a market could be handed over to the infirmary little doubt is felt that the money would be forthcoming to place upon it a building as capable of meeting the requirements of the district as was that the foundation stone of which was laid in the year 1751 by Butler, the famous Bishop of Durham. Newcastle was then a small town. Now it is a stately and a wealthy city, a great centre of industrial and intellectual activity, she should not lag behind other towns in providing adequate accommodation for the sick poor. It will be some weeks at least before an answer can be given by the finance committee, to whom the council has referred the question of the possibility of granting the infirmary an extension of the present site.

A Good Example.

The foundation stone of a fine Presbyterian church has been laid by Sir Donald Currie, M.P., on a plot of ground adjoining that on which the College of Medicine is built, and to commemorate his visit to Newcastle Sir Donald Currie generously handed the mayor a cheque for £100 as a contribution to the funds of the Royal Infirmary.

Rabies at Tynemouth.

A spaniel suffering from dumb rabies was a few days ago destroyed at Tynemouth after having been kept under observation by a veterinary surgeon for a sufficiently long period to make the nature of the disease a matter of certainty. For some time there has been a scare of rabies in the Haltwhistle district. It is believed the Tynemouth dog had not bitten any other animal. An order to muzzle all dogs in the borough of Tynemouth has been issued by the magistrates.

Destruction of Fifteen Boilers with great Loss of Life near Redcar.

On Friday night a terrible boiler explosion occurred at Warrenby, near Redcar, the explanation of which is not at present known. The furnaces were being tapped when the explosion took place. Four men were killed instantly, five others have since died, and others are seriously injured. More would have suffered had the explosion taken place a little earlier. Two hundred men are by this dreadful accident thrown out of work. The damage is estimated as amounting to £20,000. Fifteen boilers are destroyed. An inquiry by the Board of Trade is being held.

Another Fatal Accident to a Cyclist.

A young man named Jameson, while riding down a hill on Sunday last in the neighbourhood of Hexham, lost command of his cycle, and with his machine bounded over the wall of a bridge into a stream, where he was found quite dead. This is the third fatal accident in this neighbourhood within a few days, and there is a patient in the Royal Infirmary suffering from rupture of the urethra, brought about by his missing the saddle in mounting and striking his perineum on some other part of the machine.

The Visit of the Shahzada.

The Ameer's son arrived at Cragside, the seat of Lord Armstrong, with a large retinue, on Saturday from Carlisle. At Silloth he visited the range belonging to the firm of Messrs. Armstrong, Mitchell, and Co., where some cannon and other guns were fired for his edification. On Monday he came to Newcastle. An address was presented to him by the civic authorities, after which he inspected the celebrated Armstrong factory, lunched, and was shown something of the town. He told the deputy mayor he enjoyed himself; at any rate, he took an intelligent interest in everything he saw. It was noticed that one or two of his suite on the way to inspect the works, before luncheon, were asleep, but no doubt they, too, enjoyed themselves after their fashion.

Newcastle-upon-Tyne, June 18th.

SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

Cost of Hospital Extension.

THE expenditure on the additions (including furnishings) to the City Hospital, Aberdeen, up to date is £18,428 19s. 7d. This is exclusive of the cost of erecting a dwelling-house for the employes, a scheme which is at present under consideration by a committee.

An Economic Convalescent Home.

The annual gathering in connexion with the Newhills Convalescent Home, near Aberdeen, took place on Saturday last. In the cottage there and in the branch at Stonehaven 241 patients were treated last year. The Rev. Dr. Smith stated that thirty (female) patients were admitted at the little home at Stonehaven last season and that the whole cost was about £52.

Glasgow University.

At a meeting of the University Court on the 13th inst. Mr. R. Adamson, LL.D., was appointed Professor of Logic in place of the late Dr. Veitch. Mr. Adamson has for three years occupied the chair of Logic in the University of Aberdeen.—Two new lectureships have been recently instituted, one in French and the other in English Literature,

at Queen Margaret College. M. Mercier of the University of Geneva has been appointed to the former, and the latter is to be filled by Mr. A. A. Jack, B.A. Mr. Jack is a son of Dr. Jack, the Professor of Mathematics in the University.

Coöperative Seaside Home.

The foundation stone of the new home at West Kilbride was laid on the 15th inst. in the presence of a large number of representatives of the various coöperative societies in the west of Scotland. The estimated cost of the home when completed is £9000, towards which sum Mr. Wm. Barclay, Glasgow, has generously contributed £2000 to be devoted to the erection and furnishing of one of the wings of the new building.

Volunteer Ambulance Training.

The annual inspection of the Glasgow companies of the Volunteer Medical Staff Corps took place on York-hill on the 14th inst. The inspecting officer was Surgeon-Colonel Grose, Principal Medical Officer for Scotland, and Surgeon-Captain Beatson was in command. After the march past "A" Company were told off to represent an ambulance section in active service in the field, and formed dressing and collecting stations for the reception of the "wounded" brought in by the stretcher detachments. At the same time "B" Company were put through the movements of bearer company drill. The companies were then formed up, and in addressing them Surgeon-Colonel Grose expressed his gratification at the work he had seen, and said he would have pleasure in making a good report on the efficiency of the companies. Satisfaction is naturally felt in local volunteer circles that at the recent ambulance competition held at the Wellington Barracks for the challenge shield and badge the team representing the 5th Lanark took the first place, and so bring the shield north of the Border. The Lanarkshire regiment was the only Scottish corps represented in the competition.

Glasgow Royal Infirmary.

The recent changes in the staff have created a vacancy both in the position of visiting physician and visiting surgeon; and the managers have decided to return to former arrangements and to appoint two extra-dispensary physicians. For these appointments there are a number of applicants, and an energetic canvass has been in progress during the past ten days. I offer my condolences to certain of the candidates who have been so unfortunate as to suffer from an attempt to press their claims in the columns of a local weekly journal.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

The late Dr. Valentine Ball, C.B., F.R.S.

THE two events in Dublin this week of the greatest scientific importance are sadly and undoubtedly the deaths of Sir George Hornidge Porter and Dr. Valentine Ball. Of Sir George Porter I shall not attempt to speak in the space at my disposal. Dr. Ball, whose death took place on the 15th inst., although a doctor, not of medicine, but of law, was very widely known and esteemed by the medical profession in Dublin, and was brother not only of Professor Ball of Cambridge, but also of Dr. Charles Ball, our well known surgeon. After occupying for some short time the position of Professor of Geology at Trinity College, he became Director of the Science and Art Museum, Dublin, a post which he filled as successor to the late Dr. William Steele during the past twelve years. His large experience on the Geological Survey of India and his remarkable attainments in natural science rendered him highly fitted for the position which he filled with such ability, and for which it will be difficult to find a successor so highly cultured and so capable.

The New Assistant Under-Secretary for Ireland.

Professor J. B. Dougherty, M.A., has been appointed Assistant Under-Secretary for Ireland, in place of Sir W. S. B. Kaye, C.B., Q.C. Professor Dougherty is son of the late Dr. Archibald Dougherty, a well-known member of the medical profession. He was educated at Queen's College, Belfast, where he was senior scholar, and he was a gold medallist in the Queen's University. He was Professor of English Literature and Logic in Magee College, Londonderry, and for a time he was a member of the Educational Endowments (Ireland) Commission.

The Belfast Board of Guardians and the Public Health Committee.

The Belfast board of guardians having reported to the Public Health Committee of the Belfast corporation, on the authority of their dairy inspector, that there were no fewer than forty-seven cows grazing inside the city boundary which had no supply of pure water, a reply has been received to the effect that Dr. Whitaker, the superintendent medical officer of health, says that there is no nuisance injurious to health, and that the Public Health Committee were not aware of any Act of Parliament showing what water animals should be allowed to drink; but if the guardians could point out any authority by which they could act the committee would be happy to move in the matter. To this the guardians reply that, having pointed out the danger to the Public Health Committee, they do not feel called on to suggest the remedies to be applied. So the matter rests at present.

Monaghan and Cavan Asylum.

At the monthly meeting of the governors of the Monaghan and Cavan District Lunatic Asylum, held on June 14th, it was decided, with the view of applying the speediest and most economic remedy to the present overcrowding in the asylum, to recommend the purchase by the board of control of the County Monaghan Infirmary. This infirmary adjoins the asylum grounds, has an excellent supply of water and can accommodate sixty or seventy patients; and it seems that possession can be immediately acquired.

The Water-supply of Portstewart.

I understand that the Coteraine board of guardians have agreed to apply to the Board of Commissioners of Public Works in Ireland for £1000, the first instalment of the loan of £3000 granted for the construction of waterworks and sewerage works for the town of Portstewart, which is one of the most popular of the northern Irish seaside resorts.

The Belfast Royal Hospital.

On June 15th the working men's committee of the Belfast Royal Hospital paid their annual visit to the "Throne" Convalescent Home, and having made a thorough inspection of the place passed a resolution approving very cordially of the condition of the institution and strongly recommending its claims, as well as those of the Royal Hospital, to their fellow working men and women in the city of Belfast. Dr. W. Calwell, registrar of the Royal Hospital, has been appointed physician to the Throne Consumptive Hospital in place of Dr. Strafford Smith, resigned.

The Weather in the North of Ireland.

The present extraordinary weather, characterised by hot, scorching days, cold frosty nights, and with the wind blowing from the north or north-east, is doing incalculable harm in the North of Ireland. For two months we have had practically no rain, and the country at present has a burned, arid appearance very rarely seen. The hay crop is very light, turnips are a complete failure, and flax and corn are short and stunted and beginning to ripen. The only crop doing at all well is that of potatoes, but they, too, have been much injured by the frosts. In several of the northern seaside resorts, unless rain falls soon, there will be great difficulty in procuring fresh water. The general health in Belfast is good, the dry weather apparently not having any effect in increasing the death-rate.

The Londonderry Workhouse.

At the weekly meeting of the Londonderry board of guardians, held on June 15th Mr. Browne, medical officer of the workhouse, reported that the nurse's apartment was quite too small, being only 12 feet by 9 feet, and was used as a sitting-room and bedroom. The present nurse was doing as well as she could with the large number of patients (57) under her charge. He heartily approved of the proposal of the board to appoint an additional and thoroughly trained nurse. There were no proper sanitary arrangements, baths, or even proper ventilation for either nurse or patients, and he recommended the board to take this matter into their consideration. It was decided to appoint a properly trained and qualified nurse, at a salary of £30 a year with rations and apartments, to take charge of the infirmary and be assisted by the present one. It was also arranged to employ an architect to make out a specification for the improvement of the nurse's quarters, the enlargement of the surgery, and the improvement of the sanitary condition of the infirmary.

An Admiral's Brave Attempt to Rescue a Drowning Man.

On Saturday morning a foreman labourer named Kenny was showing Rear-Admiral Buckle through the tank buildings at Haulbowline, and when walking on a narrow wall separating the tanks Kenny struck his head against one of the beams overhead and fell into the water. He sank and did not even once rise to the surface. The Admiral, without waiting to divest himself of any of his clothes, hurriedly tied a rope round his waist and called on some men who were present to lower him into the tank. He quickly discovered the body, hitched a rope round it, and had it promptly drawn up. Poor Kenny was then conveyed to the Naval Hospital, where the naval surgeon, assisted by the Admiral and others, did everything possible to procure resuscitation, but all to no avail. The Admiral's pluck and presence of mind are most highly commended and have produced a favourable impression.

Important Lecture on the Housing of the Poor in Cork.

The Rev. Father Roche has been lecturing to the Cork Young Men's Society on the Plague Spots of our City. He explained that his parochial duties gave him unusual facilities for becoming disagreeably acquainted with the tenement houses of some of the slums of the city. He referred to the defective sanitary arrangements, the noisome atmosphere, the overcrowding, and the general wretchedness of some of those homes of the poor. He pointed out how such a state of things is well calculated to lower morally and physically the unfortunate beings who are obliged to drag out a miserable existence amidst such wretched surroundings. He forcibly pointed out what a strong temptation it is to such people to resort to the well-kept, comfortable tap-room of the public-house, where in winter the bright fire cheers and comforts, and where at all seasons are to be had the alcoholic potions which unfortunately are regarded by many as the panacea for driving away care and sadness. He urged that the corporation should build suitable houses and pointed out that in other cities where that had been done the municipal authorities had sustained no loss financially and incalculable benefits had been conferred on the poor. Several rows of labourers' cottages have been built in Cork from time to time, and there is every hope that the corporation, influenced by the strong representations made by the reverend gentleman, will soon make a further move in the direction he has indicated.

The Fermoy Workhouse and the Circular of the Irish Medical Association.

The report of the Irish Medical Association with regard to the treatment of the inmates of some of the Irish workhouses has already been discussed by several of the southern boards of guardians. The Fermoy board called for a report from the master, and, in reply, he states that the hospital patients are at all times under the supervision of paid officials, that the food given to them is wholesome and the best obtainable in the market, and that every attention is paid to ventilation and sanitation generally. The medical officer of the union endorsed the master's report, which was considered satisfactory by the guardians.

June 19th.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

The late Professor Verneuil.

IN the late Professor Verneuil, who died on the evening of Tuesday, June 11th, at Maisons-Laffitte, near Paris, from broncho-pneumonia, and whose death was announced in the last issue of THE LANCET, French surgery has lost a notable figure. For some months past his health had been far from satisfactory, and I remember how last summer, during professional visits I had occasion to pay at a house at Maisons-Laffitte separated only by a wall from his villa, a loud, convulsive, almost pertussive cough used to attack him for several minutes at a time. Like the late Professor Peter, Aristide Auguste Stanislas Verneuil was a Parisian, having first seen the light in this city on Sept. 29th, 1823. Pursuing his medical studies at the Paris Faculty, he was, at twenty years of age, an *externe des hôpitaux*, and from the following year, 1844, until 1848 an *interne lauréat des hôpitaux*; then successively *aide d'anatomie* and *prosecteur* (demonstrator). He was in 1852 "received" as M.D., his inaugural thesis being entitled "*Recherches sur la Locomotion du Cœur*." In August, 1853, he successfully competed for the post of *professeur-agrégé*,

his thesis being a brochure of 175 pages on the Venous System. It was, however, only three years later that he became a hospital surgeon. In 1862 we find him surgeon of the Lourcine Hospital (now rechristened Hôpital Broca), in 1865 of the Midi (now Hôpital Ricord), and then of the Lariboisière; in 1872 he passed to the Pitié; and finally, in 1889, he migrated to the Hôtel-Dieu. The lucidity of his clinical lectures procured him in 1868 his election as Professor of Surgery. His contributions to surgery were already numerous and important, his writings bearing upon diatheses and traumatism, anatomy, history of medicine, tuberculosis, cancer, &c. Amongst his later works we may specially mention his "*Chirurgie Réparatrice*" (1877), which constituted the first of the five volumes comprising his "*Mémoires de Chirurgie*." In 1877 he founded the *Revue de Médecine et de Chirurgie*, which was in 1880 split up into two journals. From 1887 to 1890 he published, in conjunction with collaborators, the "*Études Expérimentales et Cliniques sur la Tuberculose*." To the two chief plagues of suffering humanity—cancer and tuberculosis—he swore a deadly enmity, and he founded leagues against cancer and tuberculosis which were for some time productive of some good. Member of the Academy of Medicine in 1869, then President of the Surgical Society, he was in 1887 elected to fill the *fauteuil* of the late Professor Gosselin at the Académie des Sciences (surgical section). In 1889 he was promoted to a Commandership of the Legion of Honour and appointed Life-President of the Congrès de Chirurgie. In 1892 he voluntarily resigned his chair of Clinical Surgery, although he had not yet reached the limit of age necessitating such a step. When he delivered his farewell lecture at the Faculty the students and his old pupils who filled the theatre gave him an immense ovation. It is doubtful if the deceased professor will leave any marked trace of his surgical existence. Like many French surgeons of the old school, he was somewhat slow in adopting new ideas, and did not easily adapt himself to the new order of things. I well remember how opposed he was to the excision of tuberculous lymphatic glands, maintaining that the operation opened the way for fresh infection. But that he was an *esprit d'élite* is certain, and his qualities as a teacher were of a superior order. His oratorical powers were great, and he could manipulate the French language in a manner most conducive to the clear exposition of any given case. His appearance was distinctly in his favour, and his manners were most pleasant. He leaves behind him a crowd of devoted pupils, many of whom are now professors themselves.

June 18th.

ROME.

(FROM OUR OWN CORRESPONDENT.)

Political Mania.

I LITTLE thought when penning the few words which appeared in THE LANCET of June 8th on the inhibitory paresis occasioned by the high-pitched excitement of the late elections that another example of it, in its homicidal phase, would so soon be forthcoming. The lay journals have already announced the fact that Signor Ferrari, an eminent statesman, returned for Rimini by a triumphant majority against the candidate of the Opposition, was fired at by a group of Socialists as he was entering his house. The wound, in the upper region of the thorax, at first thought fatal, seemed for a few days to have taken a favourable turn. Later symptoms, however, put an end to all hope, and, though every assistance that the ablest consultants could give—prominent among them being Professor Murri of Bologna—was unremittingly bestowed, the elevation of the temperature, with the rapid pulse and the bronchopulmonary distress, too surely foreshadowed the end, which took place on June 10th.

The Policlinico.

Those of your readers who took part in the proceedings of the International Congress of Medicine and Surgery held in Rome in the Easter of 1894 will remember the "*Policlinico*" in which the nineteen sections were accommodated. Scarcely half finished at that time, the vast institution has made notable progress in the fifteen months that have since elapsed. On Friday, the 7th inst., their Majesties the King and Queen, accompanied by distinguished representatives of the Royal household, were conducted over the newly completed portions by his Excellency the Minister of Public Instruction, Dr. Bacelli. The visit was a highly gratifying

one, not only to King Humbert and Queen Margaret, but also to their host, who received from their Majesties the warmest congratulations on the satisfactorily forward state of an institution which owes to him, and to him alone, its inception and its place, already assured, among the best-equipped hospitals of Southern Europe.

Regional Congresses of Medicine.

THE LANCET of May 27th, 1893 contained an obituary notice of Dr. Giacinto Pacciotti, Professor of Surgery at Turin, one of whose chief merits was the impulse he gave to periodical meetings, regional and provincial, national and international, for the promotion of Italian medicine. His efforts were made on British lines; indeed, he was one of the most familiar figures at the annual meetings of the British Medical Association, from which he seldom failed to bring back suggestions for the still further improvement of the organisations he had so much at heart. Year by year these efforts are bearing richer and riper fruit, till the healing art, in its *ensemble*, can point to not a few memorable monographs and instructive treatises contributed on some of its obscurer departments at Italian medical congresses. One of the best organised of these has just met at Spezia. The Genoese school was ably represented, its Professor of Psychiatry, Dr. Morselli, opening the proceedings with a brilliant survey of the medical field since "evolution" became a working hypothesis in the hands of Darwin. Concentrating his observations on the "patologia cellulare" of Italian classification and on heredity in disease, he developed what he called the "endogenous" and "exogenous" conception of cellular maladies, deducing from it the double office of scientific medicine, that of "correcting and transforming" as far as possible the affected cell, and that of combating the infinitesimal yet formidable microbes which insidiously attack the defectively nourished organisms—combating these by rigid hygiene and sound alimentation. The address was a highly suggestive one, and, officially revised in the proceedings, will form a feature in their publication which will endeavour by classification and method to attain what Professor Michael Foster so much desiderated at the last great international congress—a periodical digest of the ground covered by biological, medical, and clinical research. Properly edited, indeed, the transactions and proceedings of the annual, biennial, or triennial congresses of the healing art should signally facilitate contemporary work by saving it from retraversing what is already beaten ground and economising its energies for fields untilled or but partially cultivated.

The Circolo dei Naturalisti.

I have from time to time noticed the lectures delivered at this specially Roman association as peculiarly interesting to the profession, combining as they do the pursuit of medicine with biological research, and riveting the bonds of attachment between what Hippocrates himself saw to be but two branches of the same stem—natural history and disease. The other evening the "Circolo" met in genial symposium to give a farewell banquet to one of its most prominent members, Dr. Maurizio Sacchi, who sets out in a few days for Central Africa to direct the biological side of the expedition shortly to start thither under the intrepid explorer Captain Bótego. The company included distinguished geologists like Professors De Stefani and Bucca, who hold the chairs of Geology in the schools of Florence and Catania respectively; Professor Decio Vinciguerra, lecturer on the vertebrata in the University of Genoa, who represented the Marchese Doria, President of the Geographical Society, under whose auspices the expedition has been equipped; and a large proportion of physicians and surgeons. Incidental to the occasion, it was remarked how many among the tropical explorers of all nationalities are of medical training and even graduation—equatorial Africa literally teeming with them, from the medical missionaries sent out by the Edinburgh school (the parent of that field of humanitarian enterprise) to those of Germany and France, Italy herself numbering, particularly in the regions south and west of Abyssinia, not a few young graduates in the healing art whose ambition has drawn them to those wilds in the interest of climatology and natural history in its largest sense. Indeed, the extent to which biological study, with a view to its further prosecution in the tropics, has fascinated the Roman medical school may be inferred from the Società Romana per gli Studi Zoologici, which was holding its general meeting almost contemporaneously with the symposium of the Circolo dei

Naturalisti. At the former gathering a series of original papers, short, indeed, but full of interesting observation, was read on such themes as the Zoological and Anatomohistological Characteristics of the Filaria Labiata, by Dr. Cardorelli; on the different Bryozoa Italiana, by Professor Neviana; on the New Italian Lakes (due to seismic convulsion), by Professors De Vescovi and Meli of the Roman school; and on a rare Crustacean found near Terracina by the Commendatore Luigi Ravani.

Death by Lightning.

The "apocalyptic weather" we have been having, more or less all through the spring, has latterly been characterised by peculiarly violent thunderstorms, accompanied by fatal injuries from lightning stroke quite worthy of being classed with those very remarkable cases recorded in THE LANCET of May 26th, 1894, and of Nov. 24th of the same year, the latter from the pen of Mr. R. H. E. Knaggs, M.R.C.S. Eng., Government medical officer, Trinidad, West Indies. Death from this cause may, as Mr. Knaggs observes, be rare, but that is when prompt and effective medical aid happens to be near. Unfortunately those cases just reported from the Roman and other provinces of Italy occurred at a distance from the local "dispense" and even from human habitation, excluding the sufferer from all chance of relief under the shock.

"Suicide from Overpressure."

I hear from Padua that a student of medicine in the fifth year of his curriculum has committed suicide with a revolver discharged through his temple, because he was unable to satisfy his examiners in pathological anatomy. On the evening of the tragic occurrence a mass meeting of undergraduates, after a stormy discussion, passed an "ordine del giorno" protesting against the "eccessivo rigore" of the Professor of Anatomy, openly accusing him of having driven the unfortunate student to put an end to his life. This opinion, I need hardly say, is not shared by those best qualified to judge—it being a notorious fact that the Italian schools do not repel by their "eccessivo rigore," but that their teaching and examining staff are laudably anxious to improve the standard of professional qualification and regret the time consumed by so many of the undergraduates in demonstrations by no means academic in their nature.

VIENNA.

(FROM OUR OWN CORRESPONDENT.)

Blindness caused by a Vermifuge.

IN the issue of THE LANCET of April 13th I mentioned a case of blindness caused by a vermifuge. A man aged forty-four years, suffering from abdominal pain, happened to read an advertisement of an apothecary in Budapest, who recommended a remedy against *tenia solium* and described all the symptoms in popular language. After a dose of castor oil the patient took thirty-two capsules of the vermifuge, each of which contained 0.25 gramme (= 4 grains) ethereal extract of malefern and a like amount of pomegranate root bark. In the evening he fainted, and when admitted to hospital was found to be suffering from mydriasis and total want of perception of light. Some six weeks ago he left the hospital and has not recovered his eyesight. This case has become a political event at Budapest. The blind man claimed damages, and was supported by the Socialist party, which convoked meetings for the purpose of giving publicity to the circumstances. The meetings were broken up by the police, but it is to be expected that the courts will uphold the claim of the sufferer, particularly as the pharmaceutical profession is privileged and limited by the Government, and the Austria-Hungarian Pharmacopœia expressly forbids apothecaries to sell remedies such as the above mentioned without medical prescription.

Atony of the Intestine.

At the last meeting of the Vienna Medical Club Dr. Federn delivered a lecture on the above subject. He recognises three forms of atony: (1) insufficient action of the intestine, where the faeces accumulated in the large intestine are not discharged within twenty-four hours; (2) indolence of the intestine, where the patient is suffering from inveterate constipation; and (3) partial atony, where a portion of the intestine never discharges its contents. Atony is to be diagnosed only by percussion of the large intestine, the

patient lying on his back with his knees flexed; the percussion note is dull. After a laxative the general area of dullness is increased in consequence of the coalescence of the smaller patches of dullness. The treatment consists of faradisation of the intestine and massage; laxatives are to be prescribed only when these methods have proved unsuccessful.

Vienna Medical Society.

At a recent meeting of this society Dr. Hammerschlag spoke on the subject of Cancer of the Stomach. His conclusions were based on thirty-seven cases of carcinoma and three hundred cases of other disorders. In cases of contraction of the stomach carcinoma may be certainly diagnosed without any clinical symptoms by examination of the gastric contents, which show a constant deficiency of free hydrochloric acid, and an excess of lactic acid with a diminution of pepsin. Histological examinations may show atrophy of the peptic glands.—Dr. Pal read a paper on the Innervation of the Intestines. Experiments give discordant results, especially with respect to the effect of the irritation of the vagus nerve. Besides the retarding centre in the lower cervical and the upper thoracic spinal cord, he has, he said, proved the existence of another retarding centre. He has observed the condition of the intestine before and after section of the lower cervical and upper thoracic spinal cord, and then combined this section with that of the splanchnic nerve. Peculiar spontaneous movements of the intestine resulted, and by irritation of the vagus this was increased.—Dr. Rille showed a patient affected with Alopecia and Scleroderma who had completely lost the hair from all parts of his body. In addition to absolute baldness of the scalp he had neither eyebrows, eyelashes, nor hairs in the external auditory canal. Formerly he had a well-developed beard, but at present he possesses only a few hairs on the upper lip and at the angle of the lower jaw; the extremities even show absence of the minute hairs, and on the affected places atrophy of the pigment may also be observed. The scleroderma is distributed as follows: on the right lower extremity from the crest of the ilium to the edge of the sole of the foot the skin is diffusely and symmetrically thickened and permeated by numerous yellow pigmented spots. Round the knee the skin is thinned and without pigment, being also in an atrophic stage. A central trophic disturbance is supposed to have caused these conditions. The alopecia has existed for four years and began with the form of area (Celsi); the scleroderma has existed for three years. Recovery is doubtful, though Michelson has known it to occur even after sixteen years.

RUSSIA.

(FROM OUR OWN CORRESPONDENT.)

Approaching Centenary of the St. Petersburg Army Medical Academy.

It is officially announced that the centenary of the St. Petersburg Academy of Military Medicine will be celebrated on Dec. 18th, 1898. The exact date of its foundation is not known, but the day selected is the anniversary of the signing of the imperial ukaz permitting the building of the academy. The Emperor Paul was then on the throne. The original name of the institution was the St. Petersburg Medico-Chirurgical Academy, which was subsequently changed to its present name. The first year in which its diploma was granted was the year 1800, and from the year 1801 begin the regular protocols of the conferences of the academy, which are now preserved in its archives. Its present professors will issue two historical works to commemorate the centenary. One will be a "Historical and Statistical Account of all the Separate Foundations and Chairs of the Academy"; the second will be a "History of the Academy during the Hundred Years of its Existence." The last is to be the work of Professors Ivanofski and Kosorotof. A medal will be cast to mark the occasion and a *jeton* will be given to all who are present at the centenary commemoration.

A Diagnostic Sign in Death from Cold.

Dr. Vishnevski¹ points out that an almost infallible indication that cold has been the sole cause of death is found in

¹ In the Journal of General Hygiene and Legal and Practical Medicine.

the occurrence of numerous hæmorrhages in the mucous membrane of the stomach. He found them in forty cases out of forty-four (91 per cent.). The hæmorrhages varied in number from 5 to 100, and in size from that of a grain of corn to that of a pea; they were round or oval; the distance between them was from one to two inches; the hæmorrhages were immediately under the surface; they could be easily scraped away, leaving the membrane almost normal in appearance. The mucous membrane of the stomach was congested and generally thickened and in folds. Dr. Vishnevski, in the course of 900 necropsies, had found these appearances only in the forty cases mentioned. They never occur in death from other causes, though the body be exposed to cold at the time of, or after, death. He has been able to produce the same appearances artificially in seven mice and four guinea-pigs.

Death of Dr. Eliseief.

The death occurred last week of Dr. Alexander Eliseief at the early age of thirty six. He was best known as a traveller and anthropologist. His travels led him to most parts of Russia, to Asia Minor, Japan and the East, and to Africa, where he endeavoured in 1893 to explore Abyssinia and the Soudan. This expedition was unsuccessful; his caravan was attacked and he barely escaped with his life. On his flight through the desert he suffered from heat-stroke, which affected his health for some time. He contemplated a second visit to Abyssinia this year. At the last meeting of the Anthropological Society in St. Petersburg Dr. Eliseief exhibited a Somali boy whom he had brought back with him from Africa.

The Buriats.

At the same meeting Dr. Shendrikofski communicated a very interesting account of the Buriats, a race inhabiting from time immemorial the regions round Lake Baikal in Siberia. They are an entirely pastoral race. They all, men and women, practically live in the saddle. In summer they dwell on the plains; in winter, when the snows come, they retire to the hills and live in *yurts*, huts built of wood or felt, small, rickety, and dirty. They drink sour milk and "brick" tea. They seldom eat meat, but when they do they eat it in enormous quantities, 6 lb. or 7 lb. at a time, without salt or bread. They are insatiable smokers, men and women, even children indulging inordinately. There is scarcely any social life among them. Each *ulus*, of five or six families, generally related, lives its own separate existence. Their religion was formerly Shamanism, but about a century and a half ago the Mongol Lamas were permitted to preach Buddhism among them, and Shamanism has now but few followers. The Buddhists have a Lama of their own, appointed by the Dalai Lama of Tibet, in a monastery near Selenginsk. In this monastery is a school of divinity and one of medicine. According to the medical teaching of the Lamas most diseases arise from disorders of the liver, which is looked upon as the most important organ in the body. Diagnosis, however, depends solely upon the condition of the pulse. The Buriats suffer mostly from scrofula and scurvy. Skin diseases are rare, notwithstanding their want of cleanliness. Idiotism, cretinism, malformations, and mental disorders are not uncommon, possibly on account of frequent intermarriages; but the race is not dying out, as is shown by the fact that between 1863 and 1893 their numbers increased by 20·4 per cent.

The International Monument to Lavoisier.

The proposal of the French Academy to start an international subscription to erect a monument to Lavoisier has found a warm advocate in Professor Mendileief, so far as Russia is concerned. The Emperor has appointed a committee to organise the collection of subscriptions from all parts of the country.

St. Petersburg, June 2nd (14th).

EGYPT.

(FROM OUR OWN CORRESPONDENT.)

Vaccine Institute and Small-pox.

SMALL-POX in Egypt and the Soudan is called "gadriy," an Arabic word coming from the root "to sprout," and evidently referring to the eruption. Vaccination is called "tilkyha," or fecundation, the same word being used for the artificial conception of the date tree by introducing the pollen of the male into the female. Happily in these countries

there is no anti-vaccination party, for the disease has been too recently rife for the adult population to have forgotten what a scourge it is. Twenty years ago the Circassian slaves in harems were mostly marked by small-pox, but now this is very rare, and since the English occupation there have been many instances of the disease entering harems and killing unvaccinated blacks while the vaccinated Circassians live. The natives have great faith in vaccination, though many parents would like the operation postponed until the child is not of tender years. This is only too natural in a country where infant mortality is dangerously high, especially during the summer heat. Revaccination of adults is not yet practised, except in the army, Government schools, &c. Curiously enough, the Bedouins, who are beyond the reach of practical vaccination by Government medical officers, are still in a state of evolution and practise sometimes inoculation from the small-pox patient, and sometimes vaccination from a cow. The operator uses a sharpened ostrich feather and performs upon the patient's arm. The Nubians are beginning now to appreciate vaccination, but until the last few years they knew nothing of it and practised inoculation, which they perhaps learnt from their Turkish ancestors. In Cairo itself vaccination is performed gratis by Government medical officers in the twelve districts of the city, and to avoid some of the horrors of the past, among which syphilis was not unknown, a vaccine establishment for the supply of animal lymph for all Egypt was opened in the grounds of the Sanitary Department last March. The little institute is under the control of Mr. Littlewood and Mr. Branch, the veterinary advisers to the Government. £600 only was spent on the building of a stable with four stalls, operating-room, well-furnished laboratory, &c. Already 5000 vaccinations and revaccinations have taken place, with great success, and it is intended to sell lymph to private practitioners, who at present have to procure their animal vaccine from Europe. Anyone who has vaccinated much in hot countries knows the importance of using fresh lymph; and it is difficult to praise too highly this recent development of English energy and perseverance.

Infectious Diseases.

By glancing at the weekly statistics published by the Sanitary Department it can easily be seen that the battle against small-pox is by no means concluded. During the last seven weeks there have been 379 entries into hospital tents in twenty-one different villages, mostly in Lower Egypt, and of these patients 46 have died. From one of these villages in the Delta there were 72 entries in one week, 7 in the next, and 73 entries in the third week. During the same period there have been 41 cases reported in Cairo, including three or four in the army & occupation. Typhus and relapsing fever are present every spring in Egypt, and the same seven weeks show a record of 305 cases with 51 deaths occurring in some nine villages and in Cairo, which furnished 19 cases. One of the prisons in Upper Egypt also contributed a few cases. Measles is reported from one village only; but 185 cases of influenza, none of them fatal, occurred during the first fortnight of May among the Egyptian troops at Assuan, Korosko, and Wady Halfa. The last time this disease was there in force was in the spring of 1892 when the contemplated manoeuvres had to be abandoned in consequence of the hundreds of soldiers laid low.

Pilgrimage to Mecca.

Anything in the direction of State regulation of the annual visit to the Holy Places must be welcomed. This year cholera for several weeks has been threatening the pilgrims at Mecca, and as to-day is the anniversary of the sacrificial feast, when perhaps some 80,000 Moslems will kill about the same number of sheep, buffaloes, and camels in a reeking valley where the burning sun by day and the vultures and dogs by night are the only sanitary agents, we may expect at any time to hear of the "explosion" to which we are becoming sadly accustomed. Egypt has this year made a move for the first time in the right direction and has tried to discountenance the indiscriminate "Haj" of paupers by issuing a circular in April last to all the mudirs and governors inviting them to remind intending pilgrims of a verse in the Koran: "Do not run ahead of danger." Whether it was the effect of the influence of provincial magnates, or whether it was the recollection of the 1893 cholera at Mecca, which put many Egyptian families into mourning, it is certain that hundreds of the faithful hastened to cancel their passages and remitted the sacred duty to a more convenient season. Another improvement this year is that the quarantine station at El Tor has just been inspected for the first time by English

officials. Many adverse criticisms on El Tor have been written of late years, and it is not to the credit of the quarantine department that the abuses have so long been allowed to continue. Nothing can be better than to compulsorily wash the returning pilgrims and sterilise their effects and isolate their sick; but this must be done systematically, rapidly, and thoroughly if it is not to be a ridiculous farce. We must hear no more of pilgrims being detained for several weeks to be purified in the desert, and eventually being allowed to reach Cairo with bottles of Zem-zem water and its contained sewage, perhaps reeking with cholera bacilli. It is believed that this year the absurd custom of lining the banks of the Suez Canal with Egyptian camels will be dispensed with. These troops were employed to watch ships containing pilgrims in spite of their having undergone the prescribed quarantine in two camps.

CANADA.

(FROM OUR OWN CORRESPONDENT.)

College Items.

THE third annual meeting of Trinity Medical Alumni Association was recently held in the Convocation Hall. A most interesting programme was presented. Among those present, and from whom the association heard valuable papers, were Professor Joseph Price, Philadelphia, the Philocopy of Abdominal and Pelvic Surgery; Professor Ferguson, Chicago, Radical Cure of Hernia; and Professor Roswell Park, Buffalo, Infection within the Cranium. Professor Peterson, M.A., LL.D., Principal of University College, Dundee, Scotland, has accepted the position of Principal of McGill University, Montreal, in succession to Sir J. W. Dawson. I think the University is to be congratulated upon the choice of so learned and able a person as Professor Peterson. The total number of students registered in the medical faculty of McGill University during the past session was 401, each province in the Dominion having representatives; twenty-four were from the United States.

Report of the Royal Commission on Prohibition.

During the past three years this commission has been prosecuting its work, and the findings and report have recently been presented to Parliament. The majority report is adverse to prohibitory law, as being prejudicial to the business, industrial, and commercial interests. The system of licence and regulation should not be departed from. A prohibitory law partakes too much of the character of coercive legislation on a matter in regard to which a very large portion of the people consider they are qualified and entitled to judge for themselves. As regards compensation, the commissioners consider it could not be avoided under prohibition. The treatment of habitual drunkards requires the most anxious and careful attention. No merely financial considerations should, in their opinion, prevent the best remedial measures being adopted to reclaim the victims of intemperance. That the methods at present in vogue are not only inefficient but, as a rule, demoralising, is the almost unanimous opinion of those who have to administer the law. The licensing of saloons should stop, there being no justification for their existence founded upon necessity, and it is certain that most of the evils which arise out of the immoderate use of intoxicants have their origin or are encouraged by the existence of saloons. The licensing of the compounding or mixing various kinds of liquors to produce new brands should be discontinued. Adulteration is largely carried on by the retailers. The minority report of the Rev. Mr. McLeod recommends the immediate passage of a prohibitory law. Clause 2 states that the evidence makes it clear to him that the effect of the liquor traffic has been, and is, seriously detrimental to all the moral, social, and national interests of the nation; that the measures employed to lessen, regulate, or prohibit the traffic have been of value only in proportion as they have approximated in their operation to the absolute prohibition of the traffic. I fear that the reverend commissioner has prejudged a great question which he has been delegated to inquire into first and then to deliver his judgment. Taking the report as a whole, I feel that the commissioners are to be congratulated upon the thoroughness of their inquiries, and that as a result of the commission improvements will follow in legislation on this important question.

Toronto, June 10th.

Obituary.

SIR GEORGE HORNIDGE PORTER, BART., M.D. T.C.D.,
F.R.C.S. IREL., LL.D. GLASG.,

SURGEON-IN-ORDINARY TO THE QUEEN IN IRELAND; REGIUS PROFESSOR
OF SURGERY IN THE UNIVERSITY OF DUBLIN.

THE surgical profession, not only in Ireland, but in the whole of Great Britain, has sustained a severe loss by the death of Sir George Hornidge Porter, who died last Sunday, June 16th, at his residence in Merrion-square, Dublin.

Sir George Hornidge Porter was the only son of the late Mr. William Henry Porter, Professor of Surgery in the Royal College of Surgeons, Ireland, was born in 1822 and was educated in the school of the Royal College of Surgeons and in the University of Dublin, where he graduated in Arts and Medicine, receiving the degrees of Bachelor of Arts and Bachelor of Medicine in 1845. In

1849 he was elected surgeon to the Meath Hospital, where he was engaged in active operative practice for nearly half a century. In 1860 he was appointed Examiner in Surgery in the Royal College of Surgeons in Ireland, of which body he was President in 1868 the year after the termination of his examinership. During this period also he was elected consulting surgeon to the Coombe Lying-in Hospital (1861) and surgeon to Simpson's Hospital, in the room of Mr. Hutton, in 1866. In the year 1869 Sir George Porter was appointed Surgeon-in-Ordinary to the Queen in Ireland. In 1876 he received the appointment of consulting surgeon to St. Mark's Ophthalmic Hospital, and in 1881 to Dr. Stevens' Hospital. The honour of knighthood was conferred upon him by the Queen in the year 1883 "to mark his high position among the surgeons of the United Kingdom."

In 1888 the University of Glasgow gave him the degree of LL.D. (*honoris causa*), and in 1889 he was created a baronet "in recognition of his distinguished position in the surgical profession." Between the years 1857 and 1878 Sir George Porter made many contributions to the literature of his profession. These were chiefly accounts of operations published in the *Dublin Quarterly Journal of Medical Science*, and dealt with diseases and injuries of the upper and lower limbs, the jaw, and especially the bladder. Sir George Porter was consulting surgeon to six different hospitals—Dr. Stevens', Sir Patrick Dun's, The Rotunda, St. Mark's Ophthalmic, The Coombe Lying-in, and the National Children's.

This record of work sufficiently shows that in Sir George Porter we have lost a man of the highest rank in his profession, and one, moreover, who looked only to his profession, its practise and its literature, to exalt him among his fellow-citizens. By heredity and by profession a surgeon, his single-minded devotion was rewarded by unqualified success. He was, indeed, a member of a distinguished roll of surgeons, and his life formed a connecting link between the past and present, his career serving alike as an

incitement to the younger members of the profession and a useful and pleasant source of reminiscence to the older. Very few surgeons have won more solid honours in their profession or held more honourable and numerous appointments with greater satisfaction to those who thereby benefited by the services they obtained—the bare list we give above proves this to demonstration—and none have been more beloved by his friends, his patients, and his pupils. And this means a great deal, for we are proud to know that most of the distinguished leaders of the medical profession have been regarded by their disciples and their patients with the highest affection, so that in saying that Sir George Porter was so regarded to an extent that we believe unsurpassed we are speaking no light eulogy of him. His advice and skill—and, for that matter, his purse—were ever at the disposal of those of his poorer brethren who required any or all of them; and while his geniality and kindness of heart appealed more particularly to some, to others his wide range of surgical learning and his practical ability with knife or pen may remain his memorable traits. One small episode in his surgical career is worth mentioning, because through it his name will

always be associated with one of the most lurid passages in his country's history. In conjunction with Dr. Edward Hamilton and Dr. Lambert Hepenstal Ormsby, he made the official examination of the murdered bodies of Lord Frederick Cavendish and Mr. Burke after the Phoenix-park atrocities.

In his private life Sir George Porter was also an important citizen. He was a justice of the peace and a deputy-lieutenant for the county of Wexford, where he had a large landed estate, and served the office of high sheriff some fifteen years ago. He married Julia, second daughter of a Mr. Isaac Bond of Flimby, Cumberland, by whom he had one child, Mr. William Henry Porter, the present baronet, a barrister-at-law and an accepted candidate for the Tower Hamlets. Although, as our present estimate of old age goes, Sir George

Porter was not a very

old man, his death cannot have been unexpected among his friends. He had during several winters suffered severely from bronchitis, and during the past six months had been in very indifferent health, although he could not be persuaded to take due rest and care of himself. But distressing attacks of dyspnoea at last became so frequent that he consented to go to Torquay with a view to the improvement of his pulmonary condition. While there he did not improve, and on being removed back to his home made but a short rally, dying of cardiac failure supervening upon his respiratory troubles. The funeral took place on Thursday last at Whitechurch, Rathfarnham.

HANS WILHELM MEYER, M.D.

We greatly regret to announce the death of Etatsraad Dr. Hans Wilhelm Meyer of Copenhagen in his seventy-second year, which occurred from typhoid fever at Venice on June 3rd last. Although, perhaps, not one of the greatest of the medical lights of the age, it must yet be accorded that

SIR GEORGE HORNIDGE PORTER, BART.

he was one of the greatest benefactors of his day, in that he was the first to ascribe full importance to that hypertrophy of the lymphoid tissue in the post-nasal space for which his nomenclature of adenoid vegetations is now almost universally adopted. Probably Czermak in 1860 was the first who actually saw and described the condition, while in 1865 Voitolini reported a case in an adult, where he associated deafness with the growths on the posterior naso-pharyngeal wall; and in the same year Loewenberg described three such instances, also associated with deafness, and assumed that the neoplasms were probably identical in structure with the so-called granulations of granular pharyngitis. But it was reserved to Meyer to emphasize the immense importance such hypertrophies assume in childhood, and to describe fully the proper methods of operation, the elements of prognosis, and the essential points for the prevention of recurrence—points only too often forgotten even in this day, when the number of post-nasal operations performed daily in London is enormous. In 1868 Meyer contributed his first complete statement of the subject,¹ and in 1870 this paper was communicated to the Royal Medical and Chirurgical Society by the late Professor John Marshall, F.R.S., and is published in Vol. LII. of the society's Transactions. But it was perhaps only after reading his paper at the International Medical Congress, held in London in 1882, that the profession in this country fully awoke to the importance of the subject, and now, twenty-seven years since the publication of Meyer's first paper, although the opposition to the new discovery has been as strong as would be expected in certain quarters, there are probably not many who have not seen sufficient results of operation to be compelled to accept those growths as one of the most important factors with which we have to deal in considering the diseases of children. Many are now going through life handicapped with incurable ear disease from which they would have been saved had Meyer's work been done earlier; and it is to be hoped that many more will realise that their whole lives have been changed for them, thanks to the patient work of Wilhelm Meyer. It is, however, curious to note that he himself, after the examination of 2000 school children, calculated the growths to be present in not more than 1 per cent., although we believe that most specialists would now affirm either that he had greatly underrated the frequency or that the disease has become extraordinarily more prevalent since his time.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen were elected examiners in the subjects indicated for the ensuing collegiate year at the ordinary meeting of the Council on Thursday, the 13th inst. :—

FIRST EXAMINATION.

ELEMENTARY ANATOMY.

Hutchinson, Jonathan, jun., F.R.C.S. Eng., London Hospital.
Jessop, Walter H. H., F.R.C.S. Eng., M.A., M.B. Camb., St. Bartholomew's Hospital.
Roughton, Edmund W., F.R.C.S. Eng., St. Mary's Hospital.
Waterhouse, Herbert F., F.R.C.S. Eng., M.D., C.M. Edin., Charing-cross Hospital.

ELEMENTARY PHYSIOLOGY.

Bradford, John Rose, M.R.C.S. Eng., M.D., D.Sc. Lond., F.R.S. University College, London.

ELEMENTARY BIOLOGY.

Buckmaster, George A., M.R.C.S. Eng., M.A., M.D. and D.P.H. Oxon., St. George's Hospital.
Dean, Henry Percy, F.R.C.S. Eng., B.Sc., M.B. and B.S. Lond., London Hospital.

SECOND EXAMINATION.

ANATOMY.

Lucas, Richard Clement, F.R.C.S. Eng., M.B. and B.S. Lond., Guy's Hospital.
Makins, George Henry, F.R.C.S. Eng., St. Thomas's Hospital.
Walsham, William Johnson, F.R.C.S. Eng., St. Bartholomew's Hospital.
Young, Alfred Henry, F.R.C.S. Eng., M.B. and C.M. Edin., Owens College, Manchester.

PHYSIOLOGY.

Halliburton, Wm. Dobinson, M.R.C.S. Eng., M.D. and B.Sc. Lond., M.R.C.P. Lond., F.R.S., King's College Hospital.
Power, D'Arcy, F.R.C.S. Eng., M.A. and M.B. Oxon., St. Bartholomew's Hospital.
Spencer, Walter George, F.R.C.S. Eng., M.B. and M.S. Lond., Westminster Hospital.

¹ Hospitals Tidende, Nov. 4th and 11th.

THIRD AND FINAL EXAMINATION.

MIDWIFERY.

Duncan, William, F.R.C.S. Eng., M.R.C.P. Lond., M.D. Brussels, Middlesex Hospital.
Handfield-Jones, Montagu, M.R.C.S. Eng., M.D. Lond., M.R.C.P. Lond., St. Mary's Hospital.
Herman, George Ernest, F.R.C.S. Eng., F.R.C.P. Lond., M.B. Lond., London Hospital.
Routh, Amand, J. M.C., M.R.C.S. Eng., M.D. and B.S. Lond., M.R.C.P. Lond., Charing-cross Hospital.

FIRST PROFESSIONAL EXAMINATION FOR THE FELLOWSHIP.

ANATOMY.

Haslam, William Frederick, F.R.C.S. Eng., Mason College, Birmingham.
Jacobson, Walter H. A., F.R.C.S. Eng., M.A., M.B. and M.Ch. Oxon., Guy's Hospital.
Lockwood, Charles Barrett, F.R.C.S. Eng., St. Bartholomew's Hospital.
Sutton, John Bland, F.R.C.S. Eng., Middlesex Hospital.

PHYSIOLOGY.

Lowne, Benjamin Thompson, F.R.C.S. Eng., Middlesex Hospital.
Schafer, Edward Albert, M.R.C.S. Eng., F.R.S., University College, London.
Starling, Ernest Herbert, M.R.C.S. Eng., M.D. and B.S. Lond., Guy's Hospital.
Stirling, William, M.D., C.M. and B.Sc. Edin., F.R.S. Edin., Owens College, Manchester.

DIPLOMA IN PUBLIC HEALTH.

PART I.

Turner, George, M.R.C.S. Eng., L.R.C.P. Lond., M.B. and D.P.H. Cantab., Guy's Hospital.

PART II.

Seaton, Edward, M.R.C.S. Eng., M.D. Lond., F.R.C.P. Lond., St. Thomas's Hospital.

The following gentlemen, having passed the necessary examinations, and having conformed to the by-laws and regulations, have been admitted "Fellows" of the College :—

Bennett, William Edward, L.R.C.P. Lond., Mason College, Queen's and General Hospitals, Birmingham, and St. Bartholomew's Hospital; date of Membership, July 28th, 1890.
Cooper, Percy Robert, M.B., Ch. B. Vict., L.R.C.P. Lond., Owens College and Royal Infirmary, Manchester; July 27th, 1893.
Cuff, Archibald William, M.B., B.C. Cantab., L.R.C.P. Lond., Cambridge University and St. Thomas's Hospital; July 27th, 1893.
Furnivall, Percy, L.R.C.P. Lond., St. Bartholomew's Hospital; Nov. 10th, 1892.
Gordon, James, M.B., B.S. Melb., L.R.C.P. Lond., Melbourne University and King's College Hospital; May 10th, 1894.
Green, Charles Robert Mortimer, L.R.C.P. Lond., London Hospital; May 27th, 1885.
Harris, William James, M.B. Cantab., L.R.C.P. Lond., Cambridge University and Guy's Hospital; May 11th, 1893.
Ingall, Frank Ernest, L.R.C.P. Lond., London Hospital; July 30th, 1891.
Levieck, Harry Driffild, M.B. Lond., L.R.C.P. Lond., Anderson's College, Glasgow, and St. Thomas's Hospital; Feb. 12th, 1891.
Lister, William Tindall, M.B., B.C. Cantab., L.R.C.P. Lond., Cambridge University and University College Hospital; May 9th, 1893.
Lockett, George Vernon, M.B. Edin., L.R.C.P. Lond., Royal College of Surgeons of Edinburgh and Edinburgh University; May 9th, 1896.
MacLeod, Charles Edward Alexander, L.R.C.P. Lond., Westminster Hospital; July 30th, 1891.
Marson, Francis Herbert, M.B. Durh., L.R.C.P. Lond., St. Bartholomew's Hospital, Mason College, Queen's and General Hospitals, Birmingham, Durham University and Royal Infirmary, Newcastle-on-Tyne; Nov. 10th, 1892.
Michell, Robert Williams, M.B., B.C. Cantab., Cambridge University and St. Bartholomew's Hospital; not a member.
Rowell, George, M.D. Durh., Durham University, Royal Infirmary, Newcastle-on-Tyne, St. Bartholomew's and University College Hospitals; Jan. 27th, 1870.
Shillitoe, Arthur, M.B., B.C. Cantab., L.R.C.P. Lond., Cambridge University and Guy's Hospital; Nov. 9th, 1893.
Sloane, John Stretton, M.B. Lond., L.R.C.P. Lond., St. Bartholomew's Hospital; May 11th, 1893.
Spencer, Charles George, Surgeon-Lieutenant A.M.S., M.B. Lond., L.R.C.P. Lond., University College Hospital; Aug. 1st, 1892.
Stevens, Thomas George, M.D. Lond., L.R.C.P. Lond., Guy's Hospital; July 28th, 1890.
Walton, Herbert James, L.R.C.P. Lond., St. Bartholomew's Hospital; May 11th, 1893.
Warner, Thomas, L.R.C.P. Lond., King's College Hospital; Feb. 11th, 1892.
Webb, James Ramsay, M.B., B.S. Melb., Melbourne University and London Hospital; Nov. 10th, 1892.
Wightman, Cecil Frank, L.R.C.P. Lond., St. Bartholomew's Hospital; Feb. 9th, 1893.

Three other gentlemen passed the Examination, and will be admitted Fellows at future meetings of the Council on attaining the legal age of twenty-five years. Sixteen were referred for six months and four for one year.

The following gentlemen, having passed the necessary examinations, were admitted Licentiates in Dental Surgery :—

Atkinson, Frederick George, Charing-cross Hospital and the Dental Hospital of London.
Bateman, Julius Barthroppe, Charing-cross Hospital and the Dental Hospital of London.
Bates, George Llewellyn, Charing-cross Hospital and the Dental Hospital of London.
Bellaby, Francis Montagu FitzWalter, Owens College Dental Department and Victoria Dental Hospital, Manchester.

Bennett, John Henry, Charing-cross Hospital and the Dental Hospital of London.
 Bettridge, Albert Edward, Charing-cross Hospital and the Dental Hospital of London.
 Booth, George Henry, Owens College Dental Department and Victoria Dental Hospital, Manchester.
 Bowtell, Stewart Ross, Charing-cross Hospital and the Dental Hospital of London.
 Bowden, George Henry, Guy's Hospital.
 Burton, Percy, Middlesex Hospital and the Dental Hospital of London.
 Cahill, Alfred, Guy's Hospital.
 Cannell, Edward Kemp, Charing-cross Hospital and the Dental Hospital of London.
 Cardwell, Ernest Edward, Charing-cross Hospital and the Dental Hospital of London.
 Collett, Albert James, Guy's Hospital.
 Cook, Horace, Guy's Hospital.
 Dalton, John Willie, Charing-cross Hospital and the Dental Hospital of London.
 Day, Ernest Frank, Charing-cross Hospital and the Dental Hospital of London.
 Goeschalk, Meyer, Charing-cross Hospital and the Dental Hospital of London.
 Jenkins, Thomas George, Middlesex Hospital and the National Dental Hospital.
 Johnston, William, Charing-cross Hospital and the Dental Hospital of London.
 Keall, Clarence Albert Harry, Guy's Hospital.
 Little, Frederick, University College and Dental Department, Royal Infirmary, Bristol.
 Lean, Norman Henry, Middlesex Hospital and the Dental Hospital of London.
 Mackley, Herbert Edwin, Middlesex Hospital and the Dental Hospital of London.
 Masters, Edwin Clarence Platt, Middlesex Hospital and the National Dental Hospital.
 Mathews, John Hilditch, Charing-cross Hospital and the Dental Hospital of London.
 Morgan, Edwin, Guy's Hospital.
 Mountford, Edwin Henry, Charing-cross Hospital and the Dental Hospital of London.
 Muhlenkamp, Fritz Heinrich Arthur, Guy's Hospital.
 Nowell, Walter Salmon, Middlesex Hospital and the Dental Hospital of London.
 Pearse, Cecil Gilbert, Charing-cross Hospital and the Dental Hospital of London.
 Pottler, William Frederick, M.R.C.S. Eng., St. Bartholomew's Hospital and the National Dental Hospital.
 Price, George Herbert, Charing-cross Hospital and the Dental Hospital of London.
 Quinby, Arthur Henry, Liverpool Dental Hospital and Liverpool Royal Infirmary School of Medicine Dental Department.
 Shields, John Lewis, Liverpool Dental Hospital and Liverpool Royal Infirmary School of Medicine Dental Department.
 Stevens, David Sydney, Guy's Hospital.
 Strand, Alick Condell, M.R.C.S. Eng., Middlesex Hospital and the Dental Hospital of London.
 Sugden, Thomas Edward, Middlesex Hospital and the National Dental Hospital.
 Taylor, Harry Percy, Guy's Hospital.
 Theakstone, Joseph, Owens College Dental Department and Victoria Hospital, Manchester.
 Tice, Henry William, Middlesex Hospital and the National Dental Hospital.
 Tindal, John, Charing-cross Hospital and the Dental Hospital of London.
 Trick, Walter Henry, Guy's Hospital.
 Wallace, James Sims, B.Sc., M.D., C.M. Edin., Glasgow Dental Hospital, the Dental Hospital of London, and the National Dental Hospital.
 Wallis, Herbert, Guy's Hospital.
 Williams, Charles Henry Hughes, Charing-cross Hospital and the Dental Hospital of London.

Fifteen gentlemen were referred back to their professional studies. All candidates referred at this examination will be required to produce, before admission to re-examination, a certificate of three months' additional study at a general hospital and a special dental hospital, the precise attendances required at each hospital being left to the discretion of the respective hospital authorities.

UNIVERSITY COLLEGE HOSPITAL.—Sixty sisters and nurses from this hospital enjoyed a day's holiday at Richmond on Saturday last. We strongly commend this excellent plan for ensuring a pleasant day's recreation for nurses to the secretaries of those institutions where a summer excursion is not in the annual programme.

CONSECRATION OF THE RAHRE LODGE OF FREEMASONS—H.R.H. the Prince of Wales, Most Worshipful Grand Master (president of St. Bartholomew's Hospital), has been graciously pleased to signify his intention of being present at the consecration of the Rahere Lodge, No. 2546 at St. Bartholomew's Hospital on the afternoon of Saturday, 29th inst. Freemasons who are, or who have been, connected with the hospital, and who desire to be present at the ceremony, are requested to communicate at once with Mr. T. G. A. Burns, the secretary, 25, Welbeck-street, W., or with Mr. D'Arcy Power, the treasurer-designate, 26, Bloomsbury-square, W.C. Every application should state the name and number of the member's lodge as well as his standing in the craft. The number of tickets is necessarily limited to the accommodation of the great hall of the hospital.

MEDICAL MAGISTRATE.—Dr. James Mullin of Cardiff has been placed on the Commission of the Peace for that borough.

AN ENTERPRISING DENTIST.—A registered dentist practising in North London (Mr. J. S. Armitage, 1, Colva-street, Dartmouth-park) was on May 23rd mulcted in two penalties of £5 each at the Bloomsbury county court, at the instance of the Pharmaceutical Society, for the sale of poisons, information having been given to the Pharmaceutical Society by the London and Counties Medical Protection Society.

At the annual general meeting of the members of the South-Eastern Branch of the British Medical Association held at Hastings on Wednesday, June 12th, donations of twenty guineas each were voted to the Royal Medical Benevolent College and to the British Medical Benevolent Fund. We are glad to observe that these branch organisations are beginning to recognise the work of these two great charities, which do so much for the medical profession.

SUMMER MEETING OF UNIVERSITY EXTENSION STUDENTS AT OXFORD.—The seventh summer meeting of university extension and other students will be held this year at Oxford, and will be divided into two parts, the first lasting from Aug. 1st to Aug. 12th, and the second from Aug. 12th to Aug. 26th. Included in the varied course there will be lectures on natural science during both parts of the meeting, and classes will be formed for practical work in the different divisions. Among those who have promised to lecture are Professors Green and Odling; Drs. Fison and Wade; Messrs. Carus Wilson, Marsh, Groom, and Bourne.

BEQUESTS AND DONATIONS TO HOSPITALS.—The late Mr. Ferdinand W. Arkwright, of Ryder-street, St. James's, London, has bequeathed £200 each to the Warneford and Warwickshire Hospital, the Warwick Dispensary and Cottage Hospital, and the Derby Infirmary Building Fund.—Mr. H. H. Sharland, late of Thavies-inn, London, has bequeathed £1000 each to St. Thomas's Hospital, Guy's Hospital, the Royal Free Hospital, St. Luke's Hospital, and the Hospital for Sick Children, Great Ormond-street, London.—The late Miss Phipps, of Ross, has left by her will £100 towards the funds of the Cottage Hospital, Ross.—Miss Elizabeth Frances Heaven, late of Victoria-park, Manchester, has bequeathed £1000 each to the Children's Hospital, Pendlebury, Manchester; the Royal Infirmary, Manchester; the Southern Hospital, Clifford-street, Manchester; the Ardwick and Ancoats Hospital and Dispensary, Manchester; the Hospital for Incurables, Manchester; the Salford Royal Hospital and the Convalescent Home, West-hill, Southport; and £500 to the Eye Hospital, Oxford-street, Manchester.—Mr. William Stones, late of Ash-grove, Sheffield, has bequeathed £250 each to the Sheffield General Infirmary and the Sheffield Public Hospital and Dispensary, £200 to the Chesterfield and North Derbyshire Hospital, and £100 to the Jeesop Hospital for Women, Sheffield.—Dr. Francis B. Hawkins, late of West Knighton, Dorsetshire, has bequeathed £300 of two and three-quarter per cent. Consols to the Dorset County Hospital, and £300 of the like Consols to King's College Hospital, to be applied in instituting, or assisting, a lying-in or maternity hospital in connexion with the said hospital.—The late Mr. W. H. Daubney, of Grimsby, has bequeathed £500 to the Endowment Fund of the Grimsby and District Hospital.—Mr. E. T. Parry, late of Liverpool, has bequeathed £1000 each to the Convalescent Fund respectively of the Royal Infirmary, Liverpool, the Northern Hospital, Liverpool, the Royal Southern Hospital, Liverpool, and the Infirmary for Children, Liverpool.—The late Mr. W. F. Phillips, of Westcliff, Weston-super-Mare, has bequeathed £100 each to the Bristol Infirmary, the Bristol Hospital, the Bristol Children's Hospital, and the Weston-super-Mare Hospital.—Mrs. Catherine Murton, of Bolton, Lancashire, has bequeathed to the Bolton Infirmary securities which will yield £3329.—The late Mr. J. C. Wannop, of Carlisle, has bequeathed £100 each to the Silloth Convalescent Institution and the Carlisle Dispensary.—The late Very Reverend W. R. Freemantle, Dean of Ripon, has bequeathed £1000 in trust to apply the income towards the maintenance of a cottage hospital for the parishes of Middle Claydon, East Claydon, or Steeple Claydon, and also bequeaths £100 each to the Bucks Infirmary at Aylesbury, and Jepson's Hospital at Ripon.—Mr. Chas. G. Holdforth, late of Cookridge, Horsforth, near Leeds, has bequeathed £100 to the Women and Children's Hospital at Leeds.

FOOTBALL FATALITY.—At Paisley, in a match between the St. Mirren Victoria and Fergallie teams, a member of the former team collided with an opponent, was rendered unconscious and removed to the Infirmary, where he died on Tuesday evening last.

BATHING FATALITIES.—We referred in our last week's issue to the somewhat unusual number of fatalities which had occurred in the present bathing season. Since then three from drowning while bathing are reported. A youth aged seventeen years was drowned in the Thames near Long Wittenham, and another youth, also aged seventeen, at a bathing-place known as Tumbling Bay, Oxford; their bodies were subsequently recovered. Inquests were held on them, and the evidence adduced was that neither could swim. The third case was that of a Revenue officer who, while bathing at the North Wall, Dublin, on Tuesday last, met with a similar sad fate.

BRITISH ORTHOPEDIC SOCIETY.—The first provincial meeting of this society took place at Liverpool on May 24th. After lunching together at the Adelphi Hotel the members visited the new Royal Infirmary, the Children's Infirmary, and the Southern Hospital, at the invitation of the several staffs. They were then entertained at dinner by Mr. Robert Jones, after which they adjourned to the Medical Institution, where the ordinary meeting was held. A large number of living cases were exhibited, representing torticollis, talipes treated by tarsectomy, wrenching, tenotomy, &c.; also numerous cases of knee, hip, and other joint diseases; several casts and stereoscopic slides were on view, the latter, shown by Messrs. Robert Jones and Thelwall Thomas, being most instructive as showing the advantage of stereoscopic photography in the demonstration of orthopedic measures. Mr. Robert Jones was voted to the chair and several candidates were balloted for and elected. Mr. Tubby (London) read notes of a case of talipes equino-varus, drawing attention to the rotation inwards of the lower end of the tibia and fibula which complicated these cases. He had performed osteotomy of the lower end of the tibia, the limb being afterwards put up in plaster with a satisfactory result. An interesting discussion on the treatment of intractable talipes, equino-varus, opened by Mr. Robert Jones, followed, and the meeting was brought to a close with a hearty vote of thanks to the chairman. The next meeting will be held during the British Medical Association week in London in July next.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

Midwives Registration Bill.

THE Committee stage of this measure, which was set down in the House of Lords for Tuesday, June 18th, has been postponed until Friday, June 28th. When the Bill was mentioned in the House Lord Balfour of Burleigh informed their lordships that there are a number of amendments which the Privy Council desire to see in the Bill.—Lord Playfair, on behalf of the Government, assented to the postponement of the stage. It was, as a matter of fact, found that while there are a few points of really substantive difference which must be discussed in Committee of the whole House, there were, in addition, a large number of amendments in matters of form which the Privy Council desire. Many of these are little more than drafting, but others amount to a re-casting of one or two of the clauses of the Bill. The amendments, being points on where there was no likelihood of controversy, it was agreed that a form of procedure quite well-known in the House of Lords to meet such cases should be adopted. The Bill will be reprinted as amended, and at the next stage, which will be in Committee on re-commitment, and which will be taken on Friday, the 28th, the substantive amendments can be discussed without being hampered by a mass of detail on which there is no controversy.

Factories and Workshops Bill.

The Grand Committee, at their meeting on Tuesday, June 18th, struck out of this Bill the proposal of the Government to apply to laundries the provisions of the Factory Acts. This was done on the motion of Mr. Matthews, who afterwards put before the Committee a series of special restrictions and regulations for laundries.

HOUSE OF LORDS.

MONDAY, JUNE 17TH.

Dogs Bill.

Lord Carrington, in moving the second reading of this Bill, said it was necessary on account of the increase of rabies in some portions of England. The reason for this increase was to be found to a great

extent in the number of stray dogs wandering about the country without any sort of control and the difficulty of dealing with them. If a police officer had any reason to believe that a dog found on a highway was a stray dog he might seize it; and if no application was made for it in the course of three days it might be either sold or destroyed. The Bill also gave a police officer power to destroy any dog found on a highway which he had reasonable ground for believing was affected with rabies. It therefore gave all over the country a power at present only in the hands of the Metropolitan Police. After a short debate the Bill was read a second time.

HOUSE OF COMMONS.

THURSDAY, JUNE 13TH.

Unsound Meat in London.

Mr. Hazell asked the President of the Local Government Board whether his attention has been called to the systematic sale of large quantities of unwholesome meat just beyond the area supervised by the Commissioners of Sewers of the City of London; whether he has considered the letter of Dr. Sedgwick Saunders, food analyst to the Commissioners, written in March of this year, in which he states that the sale of meat which would be at once condemned as unfit for food by any competent meat inspector goes on openly in the shops referred to, that this outside market is in the area of the Holborn Board of Works, who have not sufficient trained inspectors to examine the meat or any apparatus for dealing with it when it is condemned, and that although the Commissioners of Sewers have made proposals to the Holborn District Board of Works to take over for a time the inspection of meat in the implicated area, the Holborn board has neither accepted the offer nor dealt with the evil in any other way; and whether, in view of the fact that this meat is distributed over the metropolis, involving great risk to the people who buy the worst of it in the street markets where it is sold as cheap meat, he will use his influence with the Holborn Board of Works to ensure efficient inspection of all the meat sold within their area, either in the way proposed by the Commissioners of Sewers or in some other way.—Mr. Shaw-Lefevre replied that the Local Government Board have no information as to there being a systematic sale of large quantities of unwholesome meat in the area in question, neither has the letter of Dr. Sedgwick Saunders been communicated to them. He then said: "Since my hon. friend gave notice of this question I have communicated with the Holborn District Board of Works and I am informed that complaints have been made by inspectors under the Commissioners of Sewers for the City of London and by the officials of some other authorities that meat which is unsound is allowed to be sold in the places referred to, that on every occasion when such a charge has been made the district board have done their best to investigate the circumstances and have called for evidence to substantiate the charge, but that on no one occasion has evidence worthy of the name been put forward. I attach great importance to the enforcement of the provisions of the law as regards unsound food, and I am informed that the inspectors of the district are constantly on the alert watching for unwholesome meat, and that whenever there is adequate evidence the district board would prosecute. The consideration of the proposal of Dr. Saunders has, I am told, been delayed pending the appointment of a medical officer of health for the district, that office having recently become vacant."

A Vaccination Question.

Mr. Hopwood asked the President of the Local Government Board whether his attention had been drawn to the case of Rose Hannah Loach, of 85, Park-street, Oldbury, who recently entered the Oldbury Small-pox Hospital, Portway-road, with her child Martha, aged five months, who was suffering from confluent small-pox; whether he was aware that Mrs. Loach, having never been vaccinated or had small-pox, resisted the importunities of the sanitary inspector and medical man at the hospital, who urged her to be vaccinated, stating that she had seen her husband and children take small-pox after vaccination, and that Mrs. Loach was discharged from the hospital on the death of her infant, after close association with the worst forms of small-pox, unvaccinated and free from small-pox; and whether it was the duty of officials at small-pox hospitals to put such pressure on persons who might object to vaccination as useless and dangerous.—Mr. Shaw-Lefevre said: "I am informed that the child referred to, who was about four months old, was suffering from small-pox in a small house where arrangements for isolation were impracticable and where three cases of small-pox had previously occurred. The mother refused to allow the child to be sent to the small-pox hospital unless she was received in the hospital with the child. The sanitary inspector endeavoured to persuade her to be vaccinated before being taken to the hospital, but she refused, and the mother with her child was then admitted to the hospital. She was, it is stated, provided with a cottage which was some distance from the main buildings where the chief of the cases were. The utmost was done to prevent her from mixing with the other cases in the hospital, and after the death of the child the mother, after a bath, and her clothing having been properly disinfected, returned to her home. I see no ground for thinking that the officers did more than it was their duty to do in the case."

FRIDAY, JUNE 14TH.

Nursing in Irish Workhouses.

Mr. McCartan asked the Chief Secretary for Ireland whether his attention had been called to a letter which appeared in the Irish papers, headed "Misery in Workhouses," signed by Sir Philip C. Smyly, M.D., chairman of the Irish Medical Association, stating that a circular letter, asking for information, had been sent to the medical officers of the workhouses and workhouse infirmaries in Ireland; whether he was aware that it was publicly declared that the replies of the medical officers showed that in forty-three infirmaries the nursing was entirely in the hands of pauper women mostly burthened with children, that these women had to take charge of serious medical and surgical cases as well as of the lunatic patients, that in sixty-one infirmaries they had charge of paupers both night and day, that in sixty-five the sanitary arrangements were of the most disgusting character imaginable, and that in forty-three of them there were neither plates, knives, nor forks for the poor inmates to eat their food with; and whether, under the circumstances, he would consider the desirability of having a public inquiry into the condition, working, and the general system of workhouses in Ireland.—Mr. Morley replied that he had read the letter. The Local Government Board informed him that they did

not consider that the letter fairly represented the actual condition of workhouses in Ireland. The statement that there were forty-three workhouses in which the nursing was entirely in the hands of pauper women was, the Board pointed out, absolutely without foundation, as there was no workhouse infirmary which was not in charge of a responsible paid officer. There were 641 paid nurses in the 159 unions in Ireland, who had no duties to perform other than the nursing of the sick. Nor did the Board think that in any case patients suffered from want of proper food, as a medical officer was entitled to order any description of food he thought fit for patients under his care. With regard to sanitation, ventilation, &c., medical officers were bound by the regulations to report any defects in such matters to the guardians, and when they did this it was the Board's invariable practice to support their recommendations. Much had been done in recent years in this direction, and doubtless much still remained to be done. The Local Government Board would welcome the efforts of any organisation working with the same objects, and they only regretted that the Irish Medical Association had not seen their way to supply them with specific information upon this subject. The Board, however, had brought under the notice of their inspectors the alleged defects, which would be made the subject of detailed inquiry by them.—Mr. T. W. Russell pressed the Government to appoint a Royal Commission or a departmental committee.—Mr. Morley said he admitted there was great cause for dissatisfaction in regard to this matter, and the Local Government Board was constantly calling the attention of boards of guardians to it.—Mr. T. W. Russell intimated that when the vote for the Local Government Board was reached he would call attention to Sir Philip Smyly's letter and raise the whole question.

Imported Milk.

Mr. Herbert Gardner, in reply to a question, said that 67,580 gallons of fresh milk and cream were imported from Holland during the year 1894, and 12,210 gallons had been received from the same source during the first five months of the present year. He might add that the value of these imports was £2835 and £451 respectively, so that competition from this quarter was really of very trifling dimensions.

TUESDAY, JUNE 18TH.

Boiler Explosions.

Mr. Holland asked the President of the Board of Trade whether, in view of the large number of boiler explosions which have occurred lately, causing great loss of life and destruction of property, he would consider the desirability of introducing a Bill making it compulsory on steam users to have their boilers duly inspected from time to time.—Mr. Bryce, in reply, said he had no certain information as to the number of boilers in use in the United Kingdom; but assuming it to be between 150,000 and 200,000, the proportion of explosions is now, as it was in 1871, about 1 in 2000 per annum. In 1871 the Select Committee on Boiler Explosions reported against the introduction of any system of compulsory inspection, one of their reasons being that a great number of these explosions arise from causes independent of and apart from anything that could be prevented by periodical inspection. Having regard to this opinion and the enormous magnitude of the task which would be thrown upon the State were it to undertake the duty of periodically inspecting all boilers, much consideration would be needed before introducing such a Bill as the hon. member appeared to contemplate.

IN COMMITTEE.

Food Products Adulteration.

Sir Walter Foster's committee met again on Tuesday, June 18th, and proceeded with the examination of witnesses. At the commencement Sir Walter Foster intimated that the committee are now prepared to examine witnesses who can tell the experience of local authorities in the administration of the Adulteration Acts.

Mr. Robinson, a member of the Kensington Vestry, said that the Food and Drugs Act had worked with good effect in his district, and would work with still better effect if the local authority could reach the wholesale dealer as well as the retailer.

Mr. Hartley Wilson, President of the Liverpool and District Grocers' Association, said that very little if any adulteration was practised by the retail grocers of Liverpool and district. In his view the invoice of the wholesale merchant should be regarded as a warranty, because he did not see why the retailer should be made the innocent victim of his fraud or that of the manufacturer. Where the law was persistently infringed he would not hesitate to inflict the penalty of imprisonment, although he thought the fines now within the power of magistrates were a sufficient deterrent in ordinary circumstances. In the case of goods known to be adulterated or believed to be injurious to public health he would have an examination at the port of entry and their sale stopped. He included preserved peas and filled cheese among these goods. As to filled cheese, he thought a distinctive name should be applied to it—such, for instance, as *oleine*—so that the purchaser might be protected against fraud. The trade in this cheese was increasing in Liverpool, and, in his opinion, there was a strong public case for dealing with it. He objected to the name *cheese* because he did not think it sufficiently distinctive. It would lead to confusion and facilitate the very fraud they were anxious to stop. Wherever there was a difference of opinion between the analyst for the prosecution and the analyst for the defence, he would make it obligatory upon the magistrates to refer the sample to Somerset House. The analyses of Somerset House were regarded by the trade as very satisfactory. In his opinion prosecutions in connexion with margarine should be taken under the Margarine Acts and not under the Food and Drugs Act. To his knowledge customers objected to ask for margarine, although they knew perfectly well from the price they paid that they were being supplied with that article. It was impossible to make a verbal declaration with regard to the sale of margarine in a crowded shop. The repetition became wearisome and objectionable. There was a sentimental objection on the part of the poor to being heard asking for margarine. It was a false sentiment, and he saw no reason why the shopkeeper should be made the victim of it, as well as the victim of the traps laid for him by the inspectors. His association was of opinion that a larger percentage of water than 16 per cent. should not be allowed in butter. They based that opinion upon the report of Mr. Faber, the Commissioner of the Danish Government. In many butters the water was introduced to increase its weight. He was strongly in favour of the establishment of a board of referees to

deal with matters arising out of the Food and Drugs Act and the Margarine Acts.

Mr. Neville Lubbock, chairman of the West India Committee, gave evidence with regard to Demarara and Trinidad sugars and the methods of imitating and adulterating them which are practised. He showed to the Committee a number of samples.

The Committee then adjourned.

The Committee met again on the following day.

Mr. Tatton Egerton, M.P., said he had acted as chairman of a conference of the London Vestries, summoned on the initiative of the St. George's Vestry, to consider the administration of the Adulteration Acts and the question of their amendment. Great difficulty was experienced in checking the adulteration of milk. At the present moment, when they had no fixed legal standard, rich milk was lowered to a standard which was likely to escape a penalty if brought before a magistrate. Milk dealers knew exactly what they could do in the way of adulteration, and he believed that at the present moment in London there was practically no unsophisticated milk sold. All the great milk companies "prepared" the milk for the market to the detriment of the farmer who supplied it. Cream in milk was not of the same value as cream outside milk, and consequently it paid to extract it. He did not think that Parliament should fix a standard. This was a matter entirely for experts, who would have no difficulty in arriving at a fair average standard. His proposal in this connexion was to have a committee of analysts and others appointed under the Local Government Board, who would take steps to find out what should be the standard for milk and other commodities, and frame rules for the guidance of local authorities in the administration of the Adulteration Acts. It was a difficulty in the present state of things that members of local authorities were frequently tradesmen, who were themselves liable to prosecution under the Acts. This might account for a slackness in the administration of the Acts. He would have imported food and drugs inspected at the port of entry, so as to prevent spurious articles coming into the country. A case occurred two or three years ago in the experience of the St. George's Vestry, where butter was proved to be adulterated and sold by a very respectable tradesman, and where the action they took had a most deterrent effect, because 270 tons of butter were returned to Holland. If this butter had been examined at the port of entry it would never have got into the country. As to what he had said about unsophisticated milk, he might tell the Committee that he saw himself in the country an iron building with a small boiler and machinery driving cylinders, and farmers all sending their milk to this place, which was within 200 yards of a railway station from which a large town was being supplied with milk. He looked in and saw the separating going on, and the only conclusion he could come to was that the milk was being whittled down exactly to pass the standards which the public analyst of this large town held to be sufficient. In taking samples the vestry of St. George's sometimes employed women, but he could not say whether they were made successful in detecting adulteration than men. With regard to itinerant vendors of milk, the Conference recommended that all itinerant vendors of food or drugs should only sell from vehicles or vessels or other receptacles having printed thereon the name and address of the person who should be responsible as master for such sale, and that all itinerant vendors of milk should be registered. The Vestry of St. George's had experienced great difficulty with these itinerant vendors of milk, who, especially on Sunday mornings, did a very large business among the poorer classes. In one case when they got to the owner of the business it was found to be a child of thirteen years. They shifted their ground, frequently gave false names, and made a great deal of trouble for the Vestry.

Mr. Wynter Blyth, medical officer of health and public analyst for Marylebone, gave some account of the methods adopted in that parish in the administration of the Adulteration Acts and the results obtained. Samples of milk, he said, were regularly taken on Sunday morning, when there was special need for supervision. As to the drugs sold in the chemists' shops of the parish, he believed they were fairly up to the standards of the Pharmacopœia. He was strongly of opinion that limits of standards should be laid down for such articles as milk, butter, cream, and vinegar. At present analysts had to work on standards which were the result of appeals to Somerset House standards, not published or acknowledged, but perfectly well understood by analysts and by the trade. He did not object to the references to Somerset House if there were a little modification of the procedure. He thought, for instance, that the local analysts should be allowed to apply preservatives to the samples and to send the results and details of their analyses to be criticised. In the case of new forms of adulteration and in doubtful cases it would, in his opinion, be of great service if before a prosecution was taken Somerset House was consulted.

Mr. Stokes, Public Analyst for Paddington and Hampstead, was also examined by the committee.

Births, Marriages, and Deaths.

BIRTHS.

KEEGAN.—On June 13th, at 178, Cromwell-road, South Kensington, the wife of Brigade-Surgeon-Lieutenant-Colonel Keegan, F.R.C.S., of a daughter.
LAZARUS-BARLOW.—On June 16th, at The Acacias, Old Chesterton, Cambridge, the wife of Walter S. Lazarus-Barlow, M.D., M.R.C.P., of a son.
MCBRIDE.—On June 16th, at the White House, Berkhamsted, the wife of J. Best McBride, K.Q.C.P., L.R.C.S. Irel., of a son.
SIMPSON.—On June 11th, at The Boltons, Farnborough, Hants, the wife of J. Tracy Simpson, M.R.C.S., of a son.
WHITE.—On June 12th, at Harley-street, W., the wife of William Hale White, M.D., of a son.

MARRIAGES.

ASHDOWN-THOROLD.—On June 12th, at Christ Church, Bath, by the Rev. E. P. Cole. G. W. W. Ashdown, M.D., of Tetbury, Glos., to Gertrude Beaujolis Thorold, daughter of General Thorold, late Royal Engineers.
BOGLE-MOORE.—On June 12th, at Hampstead Parish Church, James Linton Bogle, M.D., of New Ferry Park, Cheshire, to Agnes Elizabeth Collingham, elder daughter of Henry Moore, Esq., R.A., R.W.S., of Collingham, Maresfield-gardens, Hampstead, N.W.
DENNING-LIDDLE.—On June 12th, at St. Andrew's Church, Aston, Newport, Salop, Charles Ernest Denning, L.R.C.P., of The Grange, Grinshill, Salop, to Alice Maud, eldest daughter of Charles Rowland Liddle, of Newport, Salop.
ENRAGHT-GORDON.—On June 12th, at Holy Trinity Church, Anerley, S.E., William Enraght, L.R.C.P., M.R.C.S., of Curraghmore, Anerley, to Rosa Mercedes, youngest daughter of Lieutenant-General Charles Edward Parke Gordon, C.B., of Roslyn, Weighton-road, S.E.
HILLABY-CROWTHER.—On June 12th, at the Parish Church, Castleford, by the Rev. Gardner Smith, Rector of Castleford, assisted by the Rev. J. J. Christie, M.A., Rural Dean and Vicar of Pontefract, Arthur Hillaby, M.R.C.S. Eng., L.R.C.P. Lond., son of John Hillaby, J.P., of Pontefract, to Mary, youngest daughter of the late Joseph Crowther, of Weetworth, Glass Houghton. No cards. At home July 23rd, 24th, and 25th.
PAYNE-WARMINGTON.—On June 13th, at the Church of Our Blessed Lady and St. Thomas of Canterbury, Dudley, Edward Marten Payne, M.B., C.M. Aberd., of Chichele-road, Cricklewood, N.W., to Katherine Louisa, second daughter of Edward Marcus Warmington, Solicitor, Town Clerk of Dudley.
POLLARD-GRAHAM.—On Wednesday, June 12th, at the Oratory, South Kensington, by the Rev. Sebastian Bowden, Reginald Pollard, M.B., M.R.C.S., of Southlands, Torquay, to Beatrix Lucy Steuart Graham, second daughter of Major-General G. F. J. Graham, of 4, Buckingham Palace-mansions, London.
POTT-KILBURN.—On June 12th, at St. Paul's, Rushall, Tunbridge Wells, Francis Henry Pott, M.D., of Bournemouth, to Kate Angela, eldest daughter of E. Dunbar Kilburn, of Chancellor House, Tunbridge Wells.
RAMSAY-HOPWOOD.—On June 6th, at St. George's, Hanover-square, Herbert Murray Ramsay, Surgeon-Captain Scots Guards, to Eleanor, youngest daughter of Mr. Hopwood, of Ketton Hall, Stamford.
REDMOND-BLUMFELD.—On June 12th, at St. Mary's Church, Holly-place, Hampstead, John Johnstone Redmond, L.R.C.P., L.R.C.S. I., L.M., youngest son of the late Captain Redmond, R.M., of Queens-town, to Frieda, third daughter of Louis Blumfeld, of Braueck, Hampstead.
WHITE-FITZGERALD.—On June 18th, at Framingham Pigot, by the Rev. E. Kinder, assisted by the Rev. R. H. Prowse, Rector of the Parish, Richard Wentworth White, M.R.C.S. &c., 26, St. Giles-street and Chester House, Norwich, eldest son of the late Richard White of that city, to Ethel, daughter of Major FitzGerald, of Framingham Hall.
WILMOT-BATE.—On June 12th, at Toft Church, Cheshire, Claude E. W. Wilmot, M.D., of Alrewas, to Gertrude Isabelle, second daughter of W. Alfred Bate, Esq., of Beechwood, Knutsford.

DEATHS.

GREWCOCK.—On May 26th, at Brook House, Clapton, George Grewcock, M.R.C.S., aged 53.
MALCOLM.—On June 16th, at Gainford, John Malcolm, F.R.C.S., aged 81.
PORTER.—On June 16th, at Merrion-square, Dublin, Sir George Hornidge Porter, Bart., Surgeon-in-Ordinary to the Queen in Ireland, and Regius Professor of Surgery in the University of Dublin.
WALLER.—On June 12th, at Sydenham, Charles Beaumont Waller, M.R.C.S., aged 54.
WYATT.—On April 17th, George Robert Wyatt, M.D., F.R.C.S., late of Oxford and of Naples, in his 81st year.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Medical Diary for the ensuing Week.

OPERATIONS.

METROPOLITAN HOSPITALS.

MONDAY.—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), St. George's (1 P.M.), St. Mark's (2 P.M.), Chelsea (2 P.M.), Samaritan (Gynecological, by Physicians, 2 P.M.), Soho-square (2 P.M.), Royal Orthopaedic (2 P.M.), City Orthopaedic (4 P.M.).
TUESDAY.—London (2 P.M.), St. Bartholomew's (1.30 P.M.), Guy's (1.30 P.M.), St. Thomas's (3.30 P.M.), Westminster (2 P.M.), West London (2.30 P.M.), University College (2 P.M.), St. George's (1 P.M.), St. Mary's (1.30 P.M.), St. Mark's (2.30 P.M.), Cancer (2 P.M.), Gt. Northern Central (2.30 P.M.).
WEDNESDAY.—St. Bartholomew's (1.30 P.M.), University College (2 P.M.), Royal Free (2 P.M.), Middlesex (1.30 P.M.), Charing-cross (3 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), King's College (2 P.M.), National Orthopaedic (10 A.M.), St. Peter's (2 P.M.), Samaritan (2.30 P.M.), Gt. Ormond-street (9.30 A.M.).
THURSDAY.—St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), University College (2 P.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), London (2 P.M.), King's College (2 P.M.), Middlesex (2 P.M.), Soho-square (2 P.M.), North West London (2 P.M.).
FRIDAY.—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), King's College (2 P.M.), Cancer (2 P.M.), Chelsea (2 P.M.), Gt. Northern Central (2.30 P.M.).
SATURDAY.—Royal Free (9 A.M. and 2 P.M.), Middlesex (1.30 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), University College (9.15 A.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), Cancer (2 P.M.).
 At the Royal Eye Hospital (2 P.M.), the Royal London Ophthalmic (10 A.M.), the Royal Westminster Ophthalmic (1.30 P.M.), and the Central London Ophthalmic Hospitals operations are performed daily.

SOCIETIES.

WEDNESDAY.—DERMATOLOGICAL SOCIETY OF GREAT BRITAIN AND IRELAND.—5 P.M. Dr. Shephard T. Taylor: Notes of a case of Abnormal Growth of Finger Nail. Cases to be shown by Mr. Bidwell (Rodent Ulcer of Thigh), Dr. Stowers (Disease of Nails), and others.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

MONDAY.—LONDON POST-GRADUATE COURSE.—Royal London Ophthalmic Hospital, Moorfields, 1 P.M., Mr. A. S. Morton: Ocular Injuries.—London Throat Hospital, Gt. Portland-st., W., 8 P.M., Mr. G. Stoker: Impaired Movements of the Vocal Cords.
TUESDAY.—LONDON POST-GRADUATE COURSE.—Bethlem Hospital, 2 P.M., Dr. Craig: Impulsive, Homicidal, and Moral Insanity. ROYAL COLLEGE OF PHYSICIANS, LONDON.—5 P.M. Dr. Marcet: Contribution to the History of the Respiration of Man. (Croonian Lecture).
WEDNESDAY.—NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC (Bloomsbury).—3 P.M. Lecture by Dr. Beevor.
 FUNERAL REFORM ASSOCIATION (Stafford House).—3 P.M. Annual Meeting.
 ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN (Leicester-sq., W.O.).—5 to 6 P.M. Dr. Morgan Dockrell: Mycosis Fungoides.
 LONDON POST-GRADUATE COURSE.—Royal London Ophthalmic Hospital, Moorfields, 8 P.M., Mr. W. Lang: Iritis.—Hospital for Skin Diseases, Blackfriars, 1 P.M., Dr. Payne: Affections of the Skin produced by Animal Parasites.
THURSDAY.—LONDON POST-GRADUATE COURSE.—Hospital for Sick Children, Gt. Ormond-st., 3.30 P.M., Mr. Edmund Owen: Cases from the Surgical Wards.—National Hospital for the Paralyzed, Bloomsbury, 2 P.M., Mr. O. A. Ballance: Diagnosis of Brain Abscess following Ear Disease.—Central London Sick Asylum, Cleveland-st., W., 5.30 P.M., Mr. John Hopkins: Cases in the Wards.
 ROYAL COLLEGE OF PHYSICIANS, LONDON.—5 P.M. Dr. Marcet: Contribution to the History of the Respiration of Man. (Croonian Lecture).
FRIDAY.—LONDON POST-GRADUATE COURSE.—Bacteriological Laboratory, King's College, 3 to 5 P.M., Prof. Crookshank: Tetanus, Rabies, and Cholera.
SATURDAY.—LONDON POST-GRADUATE COURSE.—Bethlem Hospital, 11 A.M., Dr. Percy Smith: Lunacy Law.
 ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN (Leicester-sq., W.O.).—5 P.M. Dr. Morgan Dockrell: Psoriasis and Seborrhoeic Dermatitis.

During the week marked copies of the following newspapers have been received:—Sunderland Herald, Newcastle Daily Journal, Celestial Empire (Shanghai), Belfast Evening Telegraph, Pioneer Mail, Architect, West Kent Advertiser, Oldham Standard, Citizen, Times of India, Builder, Leicester Post, Liverpool Courier, Bedford Standard, Derbyshire Advertiser, Walsall Observer, Birmingham Post, Huddersfield Chronicle, Brighton Argus, Sussex Daily News, Ayrshire Weekly News, Liverpool Daily Post, Sheffield Telegraph, Somerset City Herald, Lowestoft Standard, Sanitary Record, Leeds Mercury, Weekly Colonist (British Columbia), Yorkshire Post, The Weekly Budget, Answers, Bristol Mercury, Sleaford Journal, The London, Yorkshire Gazette, North Herts Journal, Courrier de la Presse, Local Government Chronicle, Mining Journal, City Press, Reading Mercury, Folkestone Express, West Middlesex Standard, Widnes Weekly News, Weekly Free Press and Aberdeen Herald, Hertfordshire Mercury, Bucks Advertiser, St. Bartholomew's Hospital Journal, Surrey Advertiser, Invergornton Times, Berkshire News, Blackpool Times, Midhurst Times, Sligo Champion, Jewish Chronicle, Oldham Evening Chronicle, Herne Bay Argus, Isle of Man Times, South Wales Daily News, Scotsman, Naval and Military Record, Perthshire Constitutional, &c., &c.

Notes, Short Comments & Answers to Correspondents.

EDITORIAL NOTICE.

It is most important that communications relating to the Editorial business of THE LANCET should be addressed exclusively "TO THE EDITORS," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

Lectures, original articles, and reports should be written on one side only of the paper.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale and advertising departments of THE LANCET should be addressed "To the Manager."

We cannot undertake to return MSS. not used.

MANAGER'S NOTICE.

A LITHOGRAPHED CIRCULAR LETTER, emanating from an office in the Strand district, is being sent to members of the medical profession, offering to supply them with THE LANCET, in conjunction with an accident insurance policy. The Proprietors of THE LANCET are in no way connected with the scheme (of which they cannot approve), and were not aware of its inception until their attention was called to it by a reader who had received the circular in question.

TREATMENT OF CANCER BY SERUM INOCULATION.

Hopeful.—We are not aware that this treatment has been tried in this country, and the trials in France mentioned by our correspondent are, we believe, almost the first of their kind. In Germany inoculation of the virus of erysipelas has been advocated on the ground that erysipelas has an adverse influence on the growth of tumours.

"STAMMERING."

To the Editors of THE LANCET.

SIRS,—My attention has been called to a letter in your last issue referring to Dr. Colman's post-graduate lecture on Stammering &c., in which the writer, Mrs. Behnke, refers to the method he quotes regarding the vocalising of sounds. This excellent method we owe neither to Dr. Wyllie nor to the late Mr. Behnke. Mrs. Behnke, instead of saying "The late Emil Behnke originated this method as far back as May, 1882," ought to have said "applied this method," as it originated on the Continent, where it has been advocated and put into practice for many years. I have myself applied it in many cases since 1865. I refer your readers, amongst others, to the works of Drs. Klencke (1862), Lehmann (1868), Guilleaume (1868), Günther (1873), and Gutzmann (1879).

I am, Sirs, yours obediently,

Fitzroy-square, W., June 17th, 1895.

WILLIAM VAN PRAAGH.

WANTED A PHILOLOGIST.

A MAN is reported to have said, in applying for a summons at a London police-court recently against a boy who had kicked his leg, that the leg was a "very serious one"—in fact, it was a "haricot leg." Noticing that his worship looked somewhat mystified, the applicant then explained that his leg had "haricot veins" in it. It would be interesting to know by what process of thought this derangement of epithets was arrived at; for, so far from being the single instance on which the phrase has come under our attention, we are aware that it is quite a usual colloquialism amongst the lower orders for varicosity of the lower extremity. But why?

WHOOPIING-COUGH.

To the Editors of THE LANCET.

SIRS,—Whooping-cough being one of the most distressing and fatal maladies peculiar to children, the excellent paper produced by Dr. Wells and Dr. Carré, and published in THE LANCET of June 8th, ought to receive every consideration at the hands of the medical profession. The subject is wide and somewhat involved in mystery; yet few medical discussions could possibly be more fruitful and productive than one upon whooping-cough. I have always looked upon this disease as one primarily affecting the peripheral terminations of the trifacial nerves, and secondarily affecting the pneumogastric. We have a disease of childhood—mumps—which chiefly affects the parotid and sometimes also the sub-maxillary glands. Is it not likely that some microbe may have an affinity for the sublingual glands, and possibly also the sub-maxillary, specially affecting their epithelial or secreting structures, and causing to be poured into the mouth a quantity of vitiated saliva swarming with morbid products? The mouth, the fauces, and the stomach become immediately infected with the saliva, and irritation is set up in the terminal filaments of the fifth nerve. This nerve supplies the four glands just mentioned, as well as the papillae at the base of the tongue and other sensitive parts that would be likely to become affected. The irritation passing up the nerve trunk would involve the other parts—the ophthalmic and superior maxillary. This would account for the redness and suffusion of the eyes and the nasal catarrh. The seat of origin in the brain of the trifacial and vagus nerves are closely approximate; so that it is not difficult to understand that an irritation might be communicated, and that the vagus, stimulated in this manner, would set up all the secondary phenomena peculiar to whooping cough. It has been proved that the saliva of man will inoculate the rabbit, and yet no change appears to take place in the blood. There is no metastatic poisoning—in fact, if it were not for the "whoop" the whole train of symptoms could be easily explained as the product of poisoned saliva causing irritation and ulceration at the mouths of the ducts of the frenum linguae—which is generally attributed to the forcible rubbing against the teeth during cough,—causing heat and pain in the mouth and fauces, producing cough, and causing indigestion and sickness owing to the presence of the starch and perverted secretion in the stomach. It is noted that the taking of food excites the cough; and, of course, the process of eating excites the gustatory, and mastication affects the buccal, nerves.

I cannot see any semblance between whooping-cough and diphtheria, and the foregoing remarks amply explain this. As for the treatment, there is little doubt but that cocaine is the most effective remedy we possess, and Dr. Wells and Dr. Carré have done a great service in bringing this treatment so prominently forward. I have recently tried the local application of cocaine to the under surface of the tongue, with excellent effect. The last case was one of the worst I have ever seen, but when the cocaine was applied the patient began to improve at once. I think that this treatment—viz., swabbing the orifices of the salivary ducts after each fit of coughing with a 5 per cent. solution of cocaine—will be found effective. Possibly, injecting by the tubes would be more effective still.

I am, Sirs, yours faithfully,

Holbeach.

THOMAS JACKSON, L.R.C.S. Edin., &c.

THE PERILS OF HOLIDAY MAKING.

To the Editors of THE LANCET.

SIRS,—Now that the holiday season is commencing it appears to me an opportune time to utter a word of warning. In company with a friend I have been making a tour in Wales where we visited most of the fashionable resorts, and in each instance established ourselves in the chief hotel—so far as we were able to ascertain. With the general attention and catering I have no fault to find, but the sanitary arrangements are mostly of such a nature as to render it dangerous to reside within the buildings. It is unnecessary for me to enter upon the structural faults, but anyone should be aware that lavatories, urinals, and w.c.'s communicating with billiard-rooms, smoke-rooms, &c. are highly suspicious, and often the source of dangerous contamination, especially if ill-constructed. The sickening odour in one instance was apparent upon entering the front door, and pervaded the whole establishment; in others it was only appreciable in the billiard or other rooms, often disguised by the pungent odour of some strong disinfectant, which we were informed was "to kill the smell." It would be obviously unfair for me to mention names, and I may further say that I have no desire to injure the business of these houses, but I do feel that those who require their bodily health improved by a pure and invigorating atmosphere should be on their guard lest in their search for better health they fall into a death-trap. If the State will not adopt some measure for their protection it would be well for the general public to take the matter into their own hands.

Through the technical instruction movement surely sufficient knowledge of the graver faults could easily be acquired, and every individual made capable of avoiding insanitary dwellings.

I may add that I also inspected boarding and lodging-houses, and often found similar defects, and I would especially urge that the assurance of managers, which is as general as it is emphatic, that "the sanitary system is perfect," is quite valueless. If they desire to assist the public I should advise them to anticipate legislation by procuring a certificate from a duly qualified expert, which should be renewed each season. The cost would be nominal, and they would not only earn the gratitude of the public but also increase their incomes. It is little satisfaction to bring an action at law for an attack of enteric fever which has ruined a constitution, and I feel confident that the "change of air," now so commonly regarded as a necessity, is often fraught with danger, and that the large majority of people would be safer in healthy homes so long as they have no means of ensuring a sanitary residence at the place of their selection.

I am, Sirs, yours faithfully,
Kidderminster, June 11th, 1895. J. LIONEL STRETTON.

"THE TITLE OF 'DR.'"

To the Editors of THE LANCET.

SIRS,—I observe in THE LANCET of the 15th inst. another question as to practitioners styling themselves "Dr." or "Physician" &c. Such questions are being continually asked in your journal. Why do not the General Medical Council issue definite rules as to such matters, and insist upon every medical man describing his full and exact registrable title on his door-plate and elsewhere? In the city in which I reside numerous non-graduate medical men call themselves "Dr." on their door-plates, and an L.S.A., I observe, styles himself "Physician." If all this is wrong, why do not the aforesaid Council exercise what I presume is their undoubted right, or possibly, as some would suppose, their undoubted duty? I am, Sirs, your obedient servant,

June 17th, 1895. OBSERVER.

To the Editors of THE LANCET.

SIRS,—Very much of sense and nonsense has of late appeared in the correspondence columns of THE LANCET on the subject of titles of medical men. Without expressing an opinion further than that mentioned above, let me ask you how, in the face of your oft-repeated assertion to inquiring correspondents that none but those possessing the degree "M.D." should be styled "Dr.," you can explain the fact that M.B.'s are constantly spoken of in THE LANCET as "Doctors"? When you state the logical reason that only M.D.'s are Doctors, why do you not adhere to your statement? Even in your current issue I observe another of your answers to a correspondent whom you advise very emphatically to "describe himself as 'physician,' that he has not the right to prefix 'Dr.' to his name, because he is not a Doctor of Medicine"; and yet in the very same issue there appear several instances in which you boldly violate this very simple rule. As far as mere title is concerned, according to your own words and according to all logical reasoning, surely Bachelors are not Doctors any more than are Licentiates, and any amount of party argument cannot alter the fact. I am, Sirs, yours faithfully,

June 17th, 1895. ANTI-HUMBUG.

. We cannot find the examples of bold violation of logic that are so apparent to our correspondent. The fact that "M.B.'s" of certain universities are by courtesy styled "Dr." exists, and it would be, therefore, discourteous to withhold the title from them. We agree that the practice—one of courtesy, we may again remind "Anti-Humbug"—may be inconsistent, but it has obvious reasons. M.B.'s are graduates of universities, which alone can confer the academic title of "Doctor." How would our correspondent address the Professor of Principles and Practice of Medicine in King's College, who is an M.B., not an M.D.? It has been, rather wildly perhaps, suggested that if the universities could be induced to surrender the title of "Doctor" to the medical profession and substitute the equivalent title of "Master" in every other faculty, many people would be spared an endless source of worry.—ED. L.

Nemo.—We do not give medical advice or recommend treatment. Our correspondent had better consult a medical man, who would advise him if the condition is one that need cause any anxiety. As a rule the symptoms mentioned are of absolutely no importance.

"THE OXYBROMIDES OF MERCURY."

To the Editors of THE LANCET.

SIRS,—In reply to "S. H.," in THE LANCET of the 15th inst., p. 1559, regarding oxybromides of mercury, arsenic &c., I beg to refer him to the Extra Pharmacopœia, eighth edition, p. 83.

I am, Sirs, yours faithfully,
New Cavendish-street, W., June 17th, 1895. WM. MARTINDALE.

To the Editors of THE LANCET.

SIRS,—If your correspondent "S. H." will be good enough to send us particulars concerning the strength of the preparations he requires, we shall be pleased to make them for him.

We are, Sirs, yours faithfully,
Berners-street, W., June 17th, 1895. ARTHUR AND CO.

THE MODIFICATION OF GERMS BY CULTURE AND THE ORIGIN OF DISEASE.

WE have received the following speculations from a physician on the ever interesting question of the development of disease. Can zymotic disease, he asks, originate *de novo*? And are disease germs capable of modification in accordance with their appropriate epochs? The questions take us into somewhat transcendental regions, but are interesting, and may prove stimulative of ideas to some of our readers.

In the student days of those of us who can look back somewhat over twenty years bacteria, bacilli, and cocci were mythical beings. Their existence was inferred by such acute reasoners as the late Dr. Murchison, but was "not proven." Now, bacteriology is a science more or less exact. It is a thing in the realm of fact that cultures of germs can be made, and that by successive cultures their virulence may be subdued. With germs of disease as with their culture, "Emollit mores, nec sinit esse feros." That the converse may also be true, and that by suitable conditions germs of disease may become more virulent appears probable, and, taken together, the fact and the theory may possibly throw some light on that vexed question, the origin of disease.

Can zymotic disease originate *de novo*? Surely, it must have done so in the past, and what has been may be again. The temperature of the incandescent mass which once represented our planet was certainly too high for any disease germs to live in—*ergo*, they must at some time have originated on the earth, either before, contemporaneously with, or after the advent of man. That they can have travelled through the ether in meteoric form seems to be an absolute impossibility, and we must regard them as earth-born atoms.

The modern theory of evolution places man late in the scheme of organic life, and, if it be correct, the lower animals may have had germs of disease ready developed to make him their prey. Looking backward along the evolutionary line, the question that suggests itself is this: Man is for the most part the outcome of heredity and environment; may not a disease germ also be the result of heredity and environment, and be modified equally with its host by these factors? Into the "will" or "spirit" force, which is behind and pervades all phenomena, we are not inquiring. We must try to answer our question in the light of the physical, not the psychic. We take it for granted that a scarlet fever germ will invariably produce scarlet fever, a typhoid fever germ typhoid fever, just as man procreates man. But, granting that man is a being slowly evolved, capable of infinite modification or infinite epochs, so may disease germs be capable of modification in their appropriate epochs. Experiments in attenuation of virus go to prove that in the laboratory such modification may be comparatively rapid. It is, then, possible that the first bacillus or coccus may have been a good cell gone wrong, begetting a progeny of still more errant children. If the germs of such diseases as scarlet fever and diphtheria, typhoid fever and cholera, measles and röteln, variella and variola, be not really distinct species, but at least first cousins, produced by a series of evolutionary changes from similar or identical parents, the occurrence of new diseases in different eras ceases to be a mystery, and comes under the law of development by evolution, which appears to be the universal order.

If we take as one illustration syphilis, which is essentially a germ disease, we find that it never originates in the conventional connexion of a healthy male and female, and we have good reason for the inference that it can only be produced by promiscuous intercourse. That being so, where does the germ of syphilis originate but in the perverted cells of incontinent animals? Again, how can sporadic cases of cholera of the Asiatic type be accounted for? A person dies in twenty-four hours with collapse, cramps, and rice-water evacuations; yet there is no epidemic of cholera, though diarrhoea and typhoid fever may be prevalent in the district. Does not such a case point to an increased virulence, or a development under suitable conditions of some less malignant germ? Supposing this hypothesis to be correct, what is the practical lesson it teaches? It is simply this—that disease germs should be attacked in their simpler forms, and the conditions for their further development denied them. Pure air, pure water, healthy life both of mind and body, and a large reserve of vital energy are the chief antagonists to the evolution of the zymotic germ.

Regis.—What our correspondent desires to do seems to us ethically permissible; but he must recognise his risk—though it is a small and unimportant one. Our advice would certainly be to wait six weeks, and so do everything in order.

WANTED A HOME.

To the Editors of THE LANCET.

SIRS,—Will you or any of the readers of THE LANCET very kindly inform me of a home or an institution wherein a lady (aged sixty-eight) in reduced circumstances could be taken care of upon payment of £50 per annum? She is suffering from paralysis, with loss of control of the sphincters. I am, Sirs, yours obediently,
Putney, June 18th, 1895. J. FRENCH BLAKE.

Subscriptions (which may commence at any time) are payable in advance.

Cheques and Post Office Orders (crossed "London and Westminster Bank, Westminster Branch") should be made payable to Mr. CHARLES GOOD, Manager, THE LANCET Office, 423, Strand, London.

An original and novel feature of "THE LANCET General Advertiser" is a special Index to Advertisements on pages 2 and 4, which not only affords a ready means of finding any notice, but is in itself an additional advertisement.

Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance. Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET.

The Manager cannot hold himself responsible for the return of testimonials &c. sent to the Office in reply to advertisements; copies only should be forwarded.

Terms for Serial Insertions may be obtained of the Manager, to whom all letters relating to Advertisements or Subscriptions should be addressed. THE LANCET can be obtained at all Messrs. W. H. Smith and Son's and other Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

The Croonian Lectures,

BEING A

CONTRIBUTION TO THE HISTORY OF
THE RESPIRATION OF MAN.*Delivered before the Royal College of Physicians of London on
June 18th, 20th, 25th, and 27th.*By W. MARCET, M.D. EDIN., F.R.C.P. LOND.,
F.R.S.LECTURE II.¹*Delivered on June 20th.*

MR. PRESIDENT AND GENTLEMEN,—Before entering on the subject proper of this lecture I must beg leave to glance at a few of the prominent contributions to our knowledge of the phenomena of human respiration. In 1849 Regnault and Reiset, from experiments on animals, observed that a marked volume of oxygen was taken in at the lungs which failed to reappear as carbonic acid in the expired air, and they established a relation between the oxygen consumed and the carbonic acid produced. These experiments were confirmed in 1891 by Messrs. Chapman and Brubecker of Philadelphia. Dr. Edward Smith, in a paper published in 1853, divides foods into two classes, according to their action on respiration—the excitatory-respiratory, which increase the production of carbonic acid, and the non-excitants, which have a contrary effect. In the former class he includes tea, sugar, coffee, rum, milk, cocoa, &c.; also gelatine and albumen, though their effect is less marked. Rum and milk have a very pronounced and persistent action. Two results are prominent in this paper: first, that fats, oils (cod-liver oil), and starch diminish the carbonic acid expired; and, secondly, that, although the ingestion of pure alcohol and rum act as respiratory excitants, still drinking brandy, whisky, and gin is attended with a diminution of the carbonic acid expired. The elaborate chamber constructed by Pettenkofer of Munich in 1863, and his important inquiries with Professor Voit into the respiration of man should be placed here on record. In 1874 C. Speck published important papers on Respiration. He observed, as will be confirmed in the present lecture, that on returning to natural respiration after forced breathing, and therefore in consequence of increased ventilation of the blood, much less air is expired for a short time than in ordinary breathing in repose; and also that the amount of carbonic acid expired in the after-effect of forced breathing falls considerably below the normal. The oxygen taken from the air is also momentarily reduced.

In 1878 Paul Bert's remarkable book on "The Effects of Barometric Pressure on Respiration" was published, and in it he states that animals dying in closed vessels, and consequently in their own carbonic acid, exhibit precisely the same symptoms as if they had perished under diminished atmospheric pressure, from which he concludes that carbonic acid is absolutely innocuous and that in such cases death is due to want of oxygen. In more recent years Dr. George von Liebig of Munich, Messrs. Jolyet Bergonié and Sigalas, and MM. Henriod and Richet have contributed a number of important and elaborate papers on Respiration. Finally, Dr. Haldane of Oxford, who has been engaged for some years with inquiries on the respiration of man and animals, has shown that while 5 per cent. of carbonic oxide in atmospheric air is fatal to mice, in an atmosphere of oxygen the proportion of carbonic oxide can be increased to 5 or 10 per cent. without fatal results; and if the pressure of the oxygen be raised by one atmosphere the two atmospheres of oxygen may be mixed with an additional atmosphere of carbonic oxide without harming the animal.

The phenomena of respiration, simple as they appear at first sight, lead on a closer inspection into details many in number and increasing in complexity the further the study is carried. In addition, these phenomena are not precisely the same for everybody; I have, therefore, repeated the experiments on as many different persons as possible. The methods adopted in the above-mentioned investigations were very various. Edward Smith inspired through one gas meter and

expired through another; while C. Speck inhaled air under atmospheric pressure from a bell jar suspended over water, and collected the air he expired in a similar receiver, the change of direction in the respiratory current being effected by delicate valves. Dr. G. von Liebig, in his experiments, instead of directly measuring the volume of air inspired, obtained it by calculation from the nitrogen found in the air expired, assuming that nitrogen was neither absorbed in the body nor given out of it in the process of respiration. After the expenditure of much time and labour in the endeavour to obtain the most accurate results by means as simple as possible, and objecting to the use of gas meters on the ground that none could be found sufficiently delicate to allow of the passage of air to and from the lungs without offering any resistance, while valves and absorbing media were open to the same objection, I finally adopted the following method: a cylindrical bell jar of sheet iron, holding about 40 litres, or 1·4 cubic foot, furnished with a scale divided into litres and fractions of a litre, was suspended in water over a pulley working on friction wheels and accurately balanced by a counterpoise. To the pulley was fixed a cycloid or lever carrying a weight, the cycloid being so constructed that the effective arm lengthened as the bell jar rose, this arrangement maintaining the receiver under atmospheric pressure at every position in its course. A thermometer and pressure gauge showed the tension of the air inside the receiver. The person under experiment inspired fresh air through the nose and expired through the mouth into a tube connected with the bell jar—a process which, with a little practice, soon became quite natural. In the later experiments a small additional weight was added to the counterpoise, which gave a very slight ascending motion to the bell jar, and thus did away with the feeble effort necessary to raise it when under atmospheric pressure only. By means of an uniformly rotating drum and a horizontal style fixed to the top of one of the three bell jars employed expiratory tracings were obtained on skeleton charts; the abscissæ engraved on the chart measured the number of litres expired, and the ordinates recorded the minutes through which the experiment was continued. The air collected in the bell jar was analysed for the determination of its carbonic acid or carbonic acid and oxygen, the amount of the former being determined by Pettenkofer's method, and the oxygen in an eudiometer of my own construction. As already stated, the volume of air inspired can be determined by calculation from the volume of nitrogen expired, assuming that the nitrogen in the expired air represents exactly the nitrogen inhaled. To find out experimentally if this assumption was correct, a measured volume of air saturated with moisture was inhaled from one bell jar and exhaled into another, thus showing in a direct manner the volumes of air inspired and expired; at the same time the volume of nitrogen in the expired air was obtained by analysis, and from it the volume of air inspired was calculated. The mean of ten experiments gave a volume of air inspired, as determined by direct observation, almost identical with that obtained by calculation from the volume of nitrogen in the expired air, thus showing conclusively that no appreciable amount of nitrogen is either absorbed or given out from the blood in the phenomenon of respiration, and also justifying the method employed. If a person, while resting in a recumbent posture in an armchair and breathing quite naturally, should measure the volume of air he expires, this volume will be found invariably smaller than the corresponding volume of air inspired. A certain volume of oxygen has remained in the body. What has become of it? Formerly this absorbed oxygen was looked upon by some authors as combining with hydrogen to form water, but of this there is no proof. Its amount is subject to great variations even in the same person, while these oscillations appear greater in young people with active tissue change than in elderly persons with a slow and regular metabolism, young people as a rule absorbing more oxygen in a given time than persons of mature age. I have also observed, as will be shown in my next lecture, that absorbed oxygen is intimately connected with the mental process of volition. The period of the maximum absorption of oxygen is undoubtedly within the first hour after a midday meal; this is a time when the carbonic acid expired is low, but the body has to prepare for the forthcoming increased assimilation and tissue-change under the influence of digestion, hence, apparently, there is a demand of oxygen by the tissues to be stored up towards these phenomena.

From the following table, giving results of experiments
C C

¹ Lecture I. was published in THE LANCET of June 22nd, 1895.
No. 3748.

on myself, it will be seen that for a person aged sixty-three the mean volume of oxygen he absorbed per minute while fasting was practically the same as under the influence of food, being 35.3 c.cm. fasting and 34.6 c.cm. while under the influence of food:—

Oxygen absorbed per Minute (Author under Experiment).

Fasting:—

Year 1891 (6 experiments), from 25.7 c.cm. to 42.8 c.cm.; mean, 35.3 c.cm.

Mean time of two and a half hours after full meal:—

Year 1891 (6 experiments), from 21.3 c.cm. to 36.7 c.cm.; mean, 30.2 c.cm.

Year 1892 (10 experiments), from 20.4 c.cm. to 46.1 c.cm.; mean, 36.7 c.cm.

Year 1894 (21 experiments), from 27.7 c.cm. to 45.0 c.cm.; mean, 37.0 c.cm.

In the case of three young men who submitted to experiment—all of them from twenty-one to twenty-three years of age, strong and in good health—the following results were obtained:—

Oxygen absorbed per Minute.

Fasting.	Nearly two hours after lunch.	Increase after lunch.
c.cm.	c.cm.	
No. 1 (6 experiments), 33.3	(6 experiments) ... 37.5	12.6 per cent.

It will be seen from this table that distinctly more oxygen was absorbed about two hours after a full meal than when fasting; hence it appears that in the case of young people there is a decided increase of the oxygen absorbed at a time when the carbonic acid produced is not far from its maximum. This is, however, not the occasion of the maximum absorption of oxygen which, as stated above, occurs in the course of the first hour after a full midday meal; this is shown by the following figures for that period:—

The author (4 experiments), 47.9 c.cm. to 58.3 c.cm.; general mean, 34.0 c.cm.

Assistant (7 experiments), 56.4 c.cm. to 81.6 c.cm.; general mean, 37.4 c.cm.

The oxygen absorbed added to the carbonic acid produced will indicate the total amount of oxygen taken from the atmosphere, or oxygen consumed. The relation between the oxygen consumed and the carbonic acid produced has been called by Regnault and Reiset "the respiratory ratio,"

and is expressed by the ratio $\frac{\text{CO}_2 \text{ produced}}{\text{oxygen consumed}}$. Now, the

value of this fraction varies considerably at all times of the day, under the influence of food and from other causes; but when calculated for the mean volumes of oxygen consumed and carbonic acid produced in the day-time in a state of rest it appears to be nearly the same for different people. Thus the mean obtained by Messrs. Jolyet, Bergeon, and Sigalas was 0.864; that obtained on myself was the same, 0.864; the corresponding figure as a mean of 27 experiments was 0.862 for one of my assistants, and 0.878 for another from 20 experiments. The subject, however, requires further investigation on account of the number of circumstances controlling this ratio, and I have found exceptions to this mean figure into which I am not yet prepared to enter.

There is no direct connexion between the CO_2 produced and oxygen consumed, and there is no meaning in the respiratory ratio unless given as a mean for the whole day in the state of rest, and even this mean is subject to exceptions. I am anxious to make this statement lest I should be misunderstood. It is impossible to trace the history of the oxygen taken from the atmosphere at the lungs by the blood corpuscles. This oxygen is carried into the tissues and there detained and stored up according to their requirements. The great increase of oxygen taken in, and the low volume of carbonic acid expired within an hour after a meal, certainly appears to show that on this occasion the tissues store up within themselves a considerable amount of oxygen in readiness to take part in the increased assimilation and tissue change resulting from the digestion of food. The reverse would take place from a sudden accession of cold, when the carbonic acid expired has been found—at all events, in my case—greatly in excess of the ordinary proportion of oxygen absorbed. On this occasion it appears as if carbonic acid is

formed at the expense of the oxygen stored up in the tissues. This view, arrived at after mature consideration of Hermann's results, does not, I am afraid, agree with that I expressed on a former occasion.

THE DIFFERENT FORMS OF RESPIRATION.

On taking a general view of human respiration it is found that this function may assume four distinctly different forms, which include the endless varieties of breathing. The first is automatic breathing in a state of repose; the second is forced or laboured breathing while the body is in a state of rest; the third is breathing while under muscular exercise; and the fourth is breathing while the body is in a perfect state of repose, with the mind or imagination actively at work towards the exercise of volition. I shall make no further remark on the first form, but pass on at once to forced respiration. If a person, while sitting with his muscles fully supported, should take a series of gasps or forced inspirations, he not only exercises his ordinary muscles of respiration, but brings into play other muscles not usually concerned in breathing in a state of repose, thus increasing the muscular labour, for which an extra amount of heat is required. The increase of labour is obvious from the fatigue experienced if the forced breathing be continued for three or four minutes in succession, and when lasting for twelve or fifteen minutes the impression is very marked. Now, although as large a volume of air is often breathed under muscular exercise as in forced breathing no fatigue whatever of the muscles of respiration is produced. The muscles directly concerned in the exercise may show signs of fatigue, but not the muscles of respiration, which have acted a secondary part in conjunction and harmony with the exercise. The experiment for forced breathing is conducted as follows. The person under experiment breathes automatically into the bell jar connected with the recording drum, and obtains a tracing of his normal breathing in repose; he then takes a succession of deep gasps for one, two, or three minutes, the recording apparatus being kept at work; after that time he relapses into normal automatic breathing while the tracing is continued on the chart for two or three minutes longer. This tracing of forced breathing is characteristic. First, the inclination of the line is considerably steeper than for normal breathing, corresponding to the expiration of a much greater volume of air in a given time; next, on relapsing into ordinary automatic breathing, the line will exhibit a tendency towards the horizontal direction for a few seconds, showing a pause in the respiration, a state of apnoea, after which the inclination of the line again rises somewhat beyond the normal, owing to another increase in the volume of air breathed. This second increased expiration, though always present, is, however, but slight; the tracing then returns parallel to that for normal respiration, the physical effects of forced breathing being now over.

[*Breathing Chart, 1.*—The lecturer here exhibited a chart which showed a tracing of normal breathing, rising at an angle of about 45° for four minutes with an expiration of eighteen litres of air. The tracing of forced breathing rose at an angle of 70° for one minute and a half with an expiration of seventeen litres of air. Upon the forced breathing ceasing a short pause appeared and then the tracing returned to nearly the normal, but the line of ascent was slightly more steep.]

A consideration of this curve shows that first of all an increased volume of air is taken into the lungs; this process is laborious and attended on that account with increased combustion, resulting in the production of a slight excess of carbonic acid; this is found experimentally to be actually the case. Next, a certain proportion of the carbonic acid stored up in the blood is displaced by the increased volume of air breathed. This phenomenon is also demonstrated by analysis. On returning to natural automatic breathing there is, as stated above, a pause or state of apnoea, due either to an accumulation of oxygen in the muscles of respiration or to the fact that, some of the carbonic acid stored up in the blood having been given out, a quiescent state of the breathing is necessary to allow the blood to charge itself afresh with that gas, and, the body containing at the same time, an excess of oxygen absorbed, there is no feeling of want of air. The next phenomenon observed after the pause is a slight increase in the air breathed beyond the normal. This increased ventilation of the lungs is clearly due to a want of oxygen in the blood, the oxygen present having been to a great extent used up during the pause; a fact showing that such is the case is that this increased breathing is more or

less marked according as the pause has been long or short. Thus far the physical character of forced breathing has been described; a few remarks have to be added on its chemistry.

During the forced respiration a certain amount of carbonic acid in excess of normal is exhaled from the blood, and at the same time the quantity of oxygen absorbed is increased. A very small portion of this excess of carbonic acid is the result of combustion due to the extra muscular work, the greater part being displaced from the blood. Obviously if such is the case, on filling several bell jars in succession with air expired in forced breathing, the second bell jar will contain a smaller excess of carbonic acid than the first, and the third smaller than the second, less and less carbonic acid being left in the blood as the experiment proceeds. The analyses in four experiments on myself and three on my assistant confirmed this view. The figures obtained in one experiment for carbonic acid emitted from the blood when disposed on a chart yielded a curve of a parabolic form. Sneezing, sighing, yawning, and sobbing come under the head of forced breathing. In sneezing, for instance, a deep inspiration is first taken, followed by a sudden expiration, which carries out with it a certain volume of carbonic acid from the blood. Immediately afterwards a pause is observed because there is in the blood an excess of oxygen and a deficiency of carbonic acid. From the pause time is given for the excess of oxygen to be used up and for the carbonic acid in the blood to be increased to the normal.

The third form of breathing is that of breathing under muscular exercise. In both its physical and chemical aspects it differs greatly from the first and second form. The moment muscular exercise of any kind is taken the volume of tidal air breathed in a given time is increased; this phenomenon is absolutely automatic and unattended with fatigue. In my experiments the exercise taken consisted of stepping sixty-six or sixty-seven times per minute, the heels being raised to a height of about four inches, when the direction of the line of breathing on the chart gave a fairly straight diagonal, with a much steeper rise than in ordinary breathing in repose. After the exercise had lasted for two or three minutes the person under experiment assumed the recumbent posture in an armchair, breathing perfectly automatically. The tracing on the chart was now observed to continue in the same direction for a length of time in a great measure proportional to that during which the exercise had been taken; then the inclination of the line became less and less steep, till it gradually returned parallel to the normal. The tracing, therefore, exhibited no pause as occurred in forced respiration.

[*Breathing Chart, 2.*—The chart here exhibited tracing of normal breathing, as in breathing chart 1; tracing of forced breathing, pause, and after-stage, also as in chart 1. The tracing of breathing under exercise showed a line rising at an angle of 60°, with an expiration of ten litres in one minute. After this, the exercise ceasing and the recumbent position being assumed, the tracing returned exceedingly gradually to the normal, there being no such marked difference as was evident on the cessation of forced breathing.]

Forced breathing, immediately following exercise, shortens the period of breathlessness on resuming the state of repose, and it is possible to regulate forced breathing in such a way that after two or three gasps normal respiration follows immediately. These remarks have a practical bearing; they show that a person much out of breath from muscular exercise, on assuming the state of repose, would experience immediate relief from a few deep gasps, and also that a long breath now and then, with a short rest, in the course of protracted exercise, would be of help to respiration.

Let us now inquire into the different stages of respiration under exercise. First of all more oxygen is wanted from the air for the heat required for the muscular work, hence a larger volume of air is breathed; at the same time an increased amount of carbonic acid is expired, but this emission of carbonic acid cannot take place at a speed proportional to the rate of its production, and it therefore accumulates in the blood. On arresting the exercise and assuming the state of repose the excess carbonic acid is given out, and with that object the lungs have to be freely ventilated; hence the state of breathlessness or dyspnoea after such exercise as running or walking. Chemical analysis shows that a large excess of carbonic acid is given out on sitting down after exercise, which carbonic acid must have been produced by muscular contraction, as there can be no excess of combustion in a state of repose, for, if there were, the temperature of the body would be raised, as the heat produced

could not be disposed of in any other way but by radiation, a consideration which led to the following experiment. Two clinical thermometers were maintained under the tongue while stepping, and left there long enough to be certain of the sublingual temperature; then one of the thermometers was removed, while at the same time the person under experiment assumed the state of repose. After about ten minutes the second thermometer was withdrawn, when both were found to give the same reading; hence there is no excess of carbonic acid formed on resting after exercise beyond a small quantity corresponding to the work done to rid the blood of the carbonic acid with which it is charged. The dyspnoea after exercise recalls an interesting experiment of Claude Bernard, who injected sulphuretted hydrogen into the circulation of a dog, and after each injection the animal drew a succession of deep breaths, thus getting rid of the gas injected by an increased pulmonary ventilation. The sulphuretted hydrogen could be clearly detected by the odour of the animal's breath and its action on paper moistened with lead acetate. Reading, talking, singing, screaming, coughing, all belong to the form of respiration under exercise. Screaming shows from its tracings that in some cases it is breathing under exercise, in others forced breathing. In the case of singing the records point out that on singing in the sitting posture there may be forced breathing, though not in the standing position; hence the importance of singing standing. In reading, talking, and singing the tracing of the "after stage" is at once parallel with the normal, showing that in these instances there is no breathlessness produced, and no excess of carbonic acid retained in the blood.

I shall beg to conclude this lecture with a few remarks on the exhalation of water from the lungs at different altitudes. The amount of this evaporation must be controlled by three different causes—the atmospheric temperature, humidity, and pressure. Given temperatures and humidity approximately equal, an elevation above the sea level will increase the evaporation together with the lowering of pressure. When on the Peak of Teneriffe in 1878 I selected four stations for experiment—one at the seaside, another at an altitude of 7090 feet, the next at 10,700 feet, and the fourth inside the shallow crater, at the very summit of the peak, at an altitude of nearly 12,200 feet. The weather was very fine, and the atmospheric humidity exhibited no great variations at the different stations, except at the seaside, where it was decidedly higher. The air expired was breathed through absorption tubes filled with calcium chloride into a bag of known capacity, the time of breathing being also observed. The humidity of the atmosphere was determined with wet and dry bulb thermometers, and the weight of moisture contained in the volume of air inspired was subtracted from the total moisture expired; thus the weight of the water evaporated from the lungs was obtained. It was found that as the altitude increased more and more water was evaporated from the lungs within a given time, although the amount of this increase was not quite proportional to the increase of altitude, clearly because the loss of water from the blood at increasing altitudes left less to be evaporated, the blood retaining necessarily a minimum quantity of water. We shall return to the subject of respiration at high altitudes in the fourth lecture.

The Bowman Lecture

ON

SUBJECTIVE VISUAL SENSATIONS.

*Delivered before the Ophthalmological Society on
June 14th, 1895.*

By W. R. GOWERS, M.D. LOND., F.R.S.,

CONSULTING PHYSICIAN TO UNIVERSITY COLLEGE HOSPITAL; PHYSICIAN
TO THE NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC.

(Concluded from p. 1595.)

SIGHT AND MOVEMENT.

THE relation of sight to movement of the body is one of the obtrusive facts of animal life. I remember once watching a flock of wild swans on the river Axe, slowly moving on the stream in uniform position. Suddenly a small dog appeared on the bank a hundred yards away. Instantly every head was turned at the same angle, every neck wa

curved and inclined in the same manner. The uniformity was an instance in which the mechanism of life is a machinery such as man's invention may produce. The same visual impulse caused the same movement in every swan. In man the relation is familiar enough, but disordered action makes it more conspicuous, because the same process occurs in a different form. The relation is presented to us in some cases of epilepsy, in which the visual sensation precedes the motion which constitutes the fit. Instead of the motion that is seen, there may be a tendency to motion only slight enough to be felt. The motion is that of turning; the sense of motion is that of vertigo. The visual aura of epilepsy may teach us something of vertigo. There are two primary movements of the body—progression forwards and rotation, walking and turning. The latter is the result of unequal activity of the centres in the two sides of the brain. If both sides act equally there is no turning; if one side acts more, or only, there is turning from that side, first of the eyes and then of the head, and lastly of the whole body. In epilepsy there is generally greater action on one side, and therefore there is this rotation, seldom of the whole body, commonly of the head and eyes.

Under normal circumstances, in ordinary life, the great cause of such rotation is the appearance of some object at one side of the field of vision. An object comes into view on the left side because it is moving towards the right. It is seen first chiefly through the right hemisphere. The visual impulse rouses the motor centres; the eyes and head turn towards the left to "fix" the object. But the object is moving towards the right, and the first movement to the left is followed by a movement towards the right, to follow it, until it disappears at the right edge of the field of vision. Then this long movement to the right is followed by a return to the mid-position by the action of the right centres. Note this alternation, and its necessary relation to the stimulation of the visual centres of one hemisphere from the opposite eye,—motor action first in that hemisphere, then in the opposite one, and lastly again in the one first active. Note that the second, opposite, activity is the longer, more extensive in its range.

Almost the first medical observation I published was that of a man with traumatic meningeal hæmorrhage over the left hemisphere. He had repeated convulsions, right-sided, which I watched for hours. In each the head and eyes turned strongly to the right as the fit came on. But this was preceded by a movement to the left, and this again by an initial slight deviation to the right. We have here, from irritation of one hemisphere, precisely the sequences just described. But compare with that active irritation the following case. A boy, at the age of five, had sudden left hemiplegia during a severe general illness. Partial recovery was followed by recurring convulsions of the left, hemiplegic, side. Each fit began thus: a slight movement of the head to the left, a much stronger and longer movement of the head towards the right, then a deviation again to the left, intense, as the boy passed into the convulsions. Here we have again the same sequence, but here we have an opportunity of discerning more of the process. The patient came under observation as a most intelligent boy of eleven years of age, and described the following warning. The figure of a man suddenly made its appearance at the extreme left of the field, slowly moving towards the right. He felt compelled to try to look at it and to follow it, and did so until it disappeared at the right edge of the field. Then he lost consciousness, and knew nothing of the subsequent strong deviation to the left in the fit. The movement to the right impressed his consciousness, and was felt as conscious turning to the right, as vertigo. Here, then, we have these sequences distinctly associated with the action of the visual centre, and, apparently, the influence of this on the motor centre. Yet one other case. In this, each fit was preceded by the sudden appearance of a blue light on the left side, sometimes of two or three near together. These always moved slowly towards the right and a little upwards, and the patient felt compelled to follow them. The head and eyes were moved towards the right in this effort, as far as they could be, by strong tonic spasm in the muscles of the neck. This occupied about thirty seconds, and then suddenly ceased on the disappearance of the visual spectrum. The eyes and head, thus released, could be moved from the right, but this movement was continued towards the left as an involuntary movement, which was, however, far greater in the eyes than in the head. For

nearly a minute the eyes were turned extremely towards the left, and the head only half-way from the mid-position. During this time he could move the head towards the right, but was absolutely unable to move the eyes from their extreme deviation to the left. Then he lost consciousness and the general convulsion of the fit came on. We have here again the same sequence, but the convulsion was not left-sided, it was general, and the final left-sided spasm had not the intensity which accompanies a left-sided fit. I could give other similar instances, but these may suffice to indicate the close relation of the head and eyes to activity of the visual centres. I may point out how indispensable, for understanding them, is the theory of the representation of both fields in the higher visual centres and of their mutual action. We must conceive that the activity of the motor centre caused by a sensation connected with the opposite edge of the field has the stronger action on the motor centre of the same hemisphere, and that the sensation connected with the side of the field which corresponds to this hemisphere has the least action. Yet the absolute gradation and intergradation of the sensation and result is compatible only with visual centres functionally one.

MICROPSY AND MACROPSY.

The visual spectra, especially spherical lights, may seem to approach nearer and nearer, or to recede. In the same way, objects that are actually seen may seem to approach or become more distant. The increased distance is associated with diminished size and sometimes with dimness of sight, but a few patients whom I have closely questioned have been clear that the apparent increase of distance was not the result of any indistinctness of vision. It may be that there is an associated change in the position of the eyeballs such as occurs when the object becomes more distant. The apparent approximation generally goes on until the object seems so near as to overwhelm the patient, and then consciousness is lost, while the apparent recession of objects passes by dimness to the same result. It would seem as though the processes of discharge and inhibition may each have a peculiar form in which objects that are seen are perceived as nearer or further, with augmentation or diminution of size. This condition is of interest as comparable possibly to the sensation of movement which results from an activity of the motor centres too slight to cause actual movement.

MIGRAINE.

From the visual spectra of epilepsy we may pass to those of migraine, those which occur as the premonition of the headache which, from vomiting so often accompanying it, is called "sick headache," and is also known, from the affection of sight by the suggestive popular name of "blind headache." These constitute the second group of subjective sensations. The two groups present a marked contrast in most of their features, and yet are not without intermediate connecting forms. The epileptic sensation is extremely brief, and precedes loss of consciousness or convulsion; the migrainous sensation is deliberate, slow in evolution, occupying more minutes than the seconds during which the epileptic sensation exists. It is followed, not by a convulsion lasting minutes, but by a headache lasting hours. Yet, just as the epileptic sensation may occur alone as the slightest form of attack, so the spectrum of migraine may occur alone without succeeding headache.

Not only are these sensations longer in duration, but they present peculiar forms. The elementary features of the migrainous spectra are very few, although their combinations are most varied. They are always simple, in the sense that they are low in the scale of sensation in its relation to mind. No visions of faces, or objects, or persons, or places ever precede the headache. Yet the sensation, simple in character, is elaborate in form, the simple elements being developed in the most complex combinations, giving rise to spectra that are extremely curious, and will one day, I doubt not, be most instructive. But that day is not yet come. All I can hope to do is to stimulate others to the minute observation and description through which alone, at some time, it may be possible to discern the meaning which the phenomena must have, a meaning as profound and important as it is now mysterious. Our knowledge of these spectra dates chiefly from the careful description of his own sensations by Dr. Hubert Aitry, which appeared in the *Philosophical Transactions of the Royal Society* for 1868, of which the plates have been reproduced in Dr. Living's admirable treatise on

Megrim, a book which will be regarded ultimately as one of the classics of the century. I am very fortunate in being able to show you to-night a series of other drawings, unpublished, which Dr. Airy has made of his sensations, accompanied by notes taken at the time. Another series of drawings of great value has been kindly made for me from his own sensations by a distinguished water-colour artist, Mr. B—. The peculiarity of the type of sensation and their manifest accuracy render these very important. Besides some other miscellaneous sources of information I must mention especially the illustrations from which one of the series of diagrams is made. In the year 1879 a man aged sixty years came under my care as an out-patient at the National Hospital for the Paralyzed and Epileptic and remained so until his death, about five years later. During those years he was subject to the frequent appearance of visual spectra, very like those of migraine, but never attended with headache. He was not an educated man, but was a mechanical engineer and mechanical draughtsman. He was an inventor; his great inventive subject was new kinds of tape, but so far as I could learn the taps could only be turned on so as to empty his own pockets, and could not be turned off. Beck was possessed with the idea that these spectra were objective things, and he delighted in depicting them in the fashion of an engineering draughtsman. The result was the book which I hold in my hand. It contains a number of illustrations of these various appearances, manifestly far too mechanical, and yet executed with a precision which makes them in some points trustworthy. They are accompanied with some rather quaint descriptions, in which it is easy to discern a definite degree of aphasia. I could not very well read them to you, even if I had time, on account of the epithets applied to myself. Perhaps the least objectionable of these, written seventeen years ago, is "the venerable Dr. Gowers." The great desire of poor Beck's last years was that the book should be brought under the notice of the Queen. Perhaps, if he had been conscious of the due relations of things, he would have recognised that the next best thing would be for his book to be brought under the notice of this Society. I have gained permission from Dr. Airy to present his drawings to the Society, provided they can be so displayed as to be available for study, and I propose also on the same condition to ask the society to retain the drawings of Mr. B— and the curious record which John Beck has left of his experiences. These constitute alone a collection of facts unique in their character, and it may be reasonably hoped that this collection may attract other representations which will constitute a source of information the importance of which cannot but increase with increasing knowledge.

SPECIAL FEATURES OF THE SPECTRA OF MIGRAINE.

The spectra of migraine present as their most important feature the zigzag or angled character, which is well known, in its curved form, as the "fortification spectrum." Its projecting and re-entrant angles bear a resemblance to the plan which the French engineer Vauban first devised as the most effective for the defence of a fortress. The second peculiar feature is the combination of this angled spectrum with loss of sight, generally bounded by the luminous zigzag, or definitely related to it. The spectral appearances perceived by Beck form a curious explanation of this rule. They were never accompanied by any dimness of sight. The angled line of light is seldom straight in its direction. It may form an angled sphere or an expanding circle or oval, which becomes incomplete, or a curved line. It is seldom a single line; usually the chief line is repeated within its concavity, never on its convexity, by lessening lines, which seem to be fading reflections, approximating so as to blend as they fade into the darkness of the loss within. But in this reflection, as it were, the lines which constitute the angles are reproduced in a peculiar manner—very beautifully shown in Dr. Airy's drawings. The angles are always regular in size, and often become progressively less towards the end of the curved zigzag line which is nearest the central point of the field. But their junction is not always exact. They may even so meet as to intersect, and form a complex sort of *chevaux de frise* very strikingly depicted in some of Mr. B—'s drawings. The double or multiple rows give rise to a peculiar appearance. This will, I think, be found important whenever the time comes for the mystery of this angled form to be unravelled. I can offer no explanation for these angled lines, nor do I think that any explana-

tion has ever been given. The conjecture has, indeed, occurred to me, but it is no more, that the form may be due to some struggle or, if the expression may be pardoned, harmonious discord, between the higher visual centres in the two hemispheres, for it seems to me difficult to doubt that in these spectra both higher centres are concerned. One strange feature which Mr. B—'s exact observation has noted as frequently observed by him, is that, at the place where the intersecting lines reach their chief development, small circles of light occupy the interspaces between the crossing lines. They are not coloured.

COLOUR IN MIGRAINOUS SPECTRA.

The frequency with which colour is seen in the angled spectrum varies. It may be transient or constant; it may be occasional only, and then is slight, and confined, as in Mr. B—'s experience, to trilling gleams where the angled element is most developed. It is most unusual for it to attain the extent and degree depicted in the diagrammatic drawings of Beck, and yet the care with which he has indicated its variations and also the unusual isolation of his spectra prevent us from dismissing his representations as too formal to be devoid of weight. Yet its presence and extent have more weight than its character. The trustworthy drawings of Dr. Airy show, however, that not only is colour, as in Mr. B—'s figures, perceived chiefly in the part of the spectrum in which the angled character is most elaborate, but that it is chiefly confined to the part of the angled spectrum in which the most intense luminosity is apparent, to the outer edge. It must be noted that here we have a very strong bounding luminous line, while in Mr. B—'s spectrum the chief development is by multiplicity of intersecting lines. Another feature is shown in Dr. Airy's figures: the colours always differ in the adjacent slopes of the lines. The contrasted direction of the lines is associated with a contrasted colour. We have, however, only four—red, blue, green, and orange; but we have four, and not the three or the six colours to which they are ultimately reduced in current theory. We must not, indeed, push too far such evidence, which can only rest upon memory. Still, the elaborateness and precision of Dr. Airy's drawings and the fact that the notes were made at the time, and the observations with purposed care, give them, I think, absolute weight. We must remember that we have here to do with the "spontaneous" action of the brain such as may result from the influence of light on the retina. Every colour—that is, every varying rapidity of the waves of light—induces the impulses in the nerve structures which pass along the optic nerves; these impulses and the processes in the centres must present a close correspondence. All we know of colour is due to these impulses, is due to the activity of the centre, and it is possible that the study of the phenomena of colour perception from the centre may serve to decide some of the many uncertain questions presented by the study of the process in the retina, which alone has hitherto engaged attention.

FORMS OF ANGLED SPECTRA.

To reduce the various forms which the angled spectra assume into any instructive order, I have found to be impossible. All I can do is to group them into what seem the chief classes into which they may be provisionally arranged for the convenience of study, and to point out the manner in which the leading elements are presented by each. Some general facts may be noted in the course of the description. The central region seems that in which there is least tendency to the discharge which causes a luminous appearance. The luminous discharge becomes gradually less as it extends into the central region. Inhibition involves this part, but not discharge. This is the opposite to that which we should expect. We should anticipate that where function is most acute and intense, spontaneous over-action would be most readily produced. It is outside the centre that the chief displays occur. They may also develop at the periphery, but if we divide the field into the three zones mentioned at the beginning of this lecture we shall find that the middle zone and inner part of the peripheral zone are the regions in which the phenomena occur in greatest development. But there is no limitation. Various forms invade all regions, with the exception of the central region. The chief forms seem to me to fall into the following classes—all, it must be understood, presenting the angled form: (1) the Angled Sphere, mobile or transient; (2) the Expanding Sphere; (3) the Progressive Curve;

(4) the Lateral Spectrum; (5) the Secondary Limiting Spectrum; and (6) a Concentric Spectrum, with, as its variety, the Arched Spectrum. I will begin with the first.

THE ANGLED SPHERE.

This is a nearly round spectrum composed of a series of projecting angles, plain or coloured. It commonly has a dark background, not much larger than itself. In every form the luminous spectrum seems to be composed of minute, brilliant points in rapid movement. This angled sphere does not change its size, but disappears as it appears. It is met with in three associations: (1) as an object which moves to and fro; (2) as an isolated initial spectrum before some other; and (3) as a terminal spectrum, thrown off, as it were, by that which has developed before. As a mobile object it was the feature of a curious case in which migraine passed into epilepsy, by no means a rare event. First, a round object appeared in the right half of the field below the horizontal line. It was composed of about six pointed projections which had the unusual feature (at least, as ascertained by careful questioning) of being pointed towards the centre. These were alternately dull red and dull blue. They appeared on a black background. This moved slowly towards the left, inclining upwards, so as to pass above the fixing point, to a little beyond the middle line, then returned to its starting point, retraced this path once or twice, and then passed to the right edge of the field, keeping the same direction, so as to come near the edge of the field at the lower outer part. Then it passed back again, only to a little beyond the spot at which it appeared, and then returned to the edge; after two or three repetitions of the last course it suddenly disappeared at the spot at which it commenced. The patient kept the eyes shut during its appearance, but on opening them when it had gone, always found she could only see in the part of the field through which the spectrum had not passed. If she looked at a face a couple of feet from her she could only see the person's ear on her left side, and all that was to the right of the ear could not be seen; in only the third of the field to the left was there vision. The loss of sight lasted about a quarter of an hour, and gradually passed away. It is an instructive instance of the relation of the inhibitory loss to the region of the field in which the spectrum appears. The case shows how the central disturbance, though primarily unilateral, ignores the medial hemiopic line. The initial and terminal angled spheres will be mentioned with the spectra to which they are related.

THE EXPANDING SPHERE.

The most frequent form of migrainous spectrum, that which is commonly regarded as the typical one, is an angled sphere which expands into an oval, and, breaking, may enlarge into a curve. The stellate sphere appears on one side of the field, nearer the centre than the periphery. Its boundary outline retains the angled form, and this extends and increases in the size of its angles, most towards the periphery. Within it vision is dimmed or lost. Yet within the boundary zigzag the outer lines may be repeated, sometimes many times, with the semblance of reflection admirably depicted in Dr. Airy's drawings, in whom this spectrum was the common form. Colours are common in the outer line, and present the features mentioned. This form is accurately depicted by Beck as a faint spectrum, usually colourless, though colours were so conspicuous in most of his visions.

The expanding oval never reaches the centre. It breaks, and either the lower limb passes far away from the fixing point, while the other is directed towards it, or both pass beyond the fixing point. In either case the zigzag becomes narrower and its angles smaller in the limbs formed by the rupture. When one is directed towards the fixing point they cease to be recognisable, and the narrowing line always ceases before the fixing point is reached—a curious illustration of the resistance to discharge in this region. It is when such an expanding spectrum passes beyond the fixing point, dividing, as it were, for the purpose, that the terminal angled sphere may develop. Just beyond the ends of the broken oval, towards the termination of the period of discharge, a stellate spectrum may appear, like that from which the expanding zigzag arose. It remains, however, unchanged until the spectrum fades. It is, as it were, an abortive attempt at a repetition of the process, as if on the other hemisphere, but it is too curious to justify even speculation.

THE PROGRESSIVE SPECTRUM.

An angled spectrum, like that which results from the

rapid separation of the limbs of the expanding form last mentioned, may arise by progressive extension through a curve in one half of the field, at the outer part of the middle or inner part of the peripheral zone. It presents features remarkably different from the expanding sphere, which it resembles in general form. A typical example is given in the careful drawings of Mr. B—, in whom it occurred in the same way, sometimes in one and sometimes in the other half of the field. There is no inhibition within the curve, as in the form last described. The first thing is a zone of darkness in the periphery of the lower quadrant. Then, above the inner part of this, a small, colourless star or angled sphere appears, to vanish when, from its neighbourhood, there develops a curved line of angles, small, and often intersecting lines. Their progress is upwards in a path concentric with the edge of the field, and may pass for a space as a sudden, straight, flash-like line, to resume the more deliberate zigzag form. It may pass beyond the middle line, in slight degree, in the upper part of the field, but attains its chief development in the upper quadrant of the side on which it commenced. There it presents the intersecting lines and small circles already mentioned, with slight tints of colour, chiefly red and blue.

THE LIMITING SPECTRUM.

The central region, as I have said, seems to possess peculiar resistance to discharge, although prone to inhibition. In the forms we have considered, in which inhibition is in direct relation to a primary spectrum, it is secondary. In one instance, carefully observed on himself by a member of our own profession, pure central inhibition was sometimes experienced, and was often limited by a spectrum in a very instructive manner. At the fixing point, a small, round or oval spot of darkness would suddenly appear, enlarging and becoming more intense at the centre. Its increase extended the loss of sight into the medial third of the field, from top to bottom, as simple loss. On each side it was then bounded by a soft edge which had the shape of a double curve, and in this form it remained, until with the onset of the headache it passed away. (You can scarcely fail to note how such a peculiar symmetrical medial loss of sight illustrates the essential unity of function of the higher visual centres.) But on many occasions the development of this spot of darkness was soon arrested on one side or the other, but always on one side only, by discharge. When the spot had extended to about half the vertical dimension of the field, a bright angled line appeared on one side, without colour, but limited by a narrow, black line on each side of the bright line. The zigzags which composed this were few and not regular. The central cloud increased and reached from top to bottom of the field; as it increased, the zigzag became more extensive, but did not move much from its first distance from the medial line, as if it interposed an obstacle to the development of the loss which it limited. On the other side, however, the loss spread more rapidly, and further than when there was no discharge, so that the ultimate result was extensive loss, bounded by a luminous line on one side, not far from the medial line, but on the other passing almost to the edge of the field. It was as if the resistance of the discharge had caused the inhibition to spread and diffuse itself over a much wider area. Symbolical as the words may seem, it is possible that they may be not far from the truth. Whenever this angled line of light appeared, the severe headache which followed was always on the opposite side to the spectrum, whichever that might be.

PERICENTRAL AND ARCH SPECTRA.

Although spectra scarcely ever develop at the fixing point itself, a spectrum around an object which occupies the fixing point is occasionally seen. A good illustration of this is presented in one of Beck's drawings, which is, I do not doubt, in this point quite trustworthy. A zigzag coloured spectrum suddenly surrounded a plate on the dinner-table before him. The quaint description he gives of it is this: "I remember well the phenomena appearing on the plate when I sat down to dinner with two friends. As I looked curious and nervous Mrs. B— said, 'Why do you not carve?' On taking my eyes off the plate I said to them, 'The zigzag rainbow colours are gone out of the window.' This was the first time my wife and friends believed I saw something very extraordinary." The drawing shows that the spectrum surrounded the edge of the plate, and the same circular spectrum in a pane of the window at which he looked up. Concentric with the plate as first seen, it maintained the same form when he raised his eyes to the window, and then disappeared. This is

Instructive, because the spectrum was evidently determined by the actual stimulation of the visual centres.

A spectrum in the form of an arch, in the mid position, above the centre, was also a frequent experience of Bäck, and may be regarded as a segment of a pericentral spectrum. It is shown in one of his drawings as becoming divided in the middle, and there is a curious symmetry in the form on each side, by which the spectrum ceases. In both these forms we are compelled to think of the perfect conjunction in action of the two higher centres. Another form of this arched spectrum is shown in one of the diagrams as a sort of angled crown above the eye. It is a curious illustration of the tendency to regard these spectra objectively. The patient was a member of our own profession, and, in response to my request for a drawing of the aspect the spectra presented to him, he sent me an objective representation of his eye with the spectrum above it, in the position in which it could only be seen by another person. This involuntary sense of objectivity is a very curious feature.

THE LATERAL SPECTRUM.

One of the simplest forms of angled spectrum is that which appears at the true periphery of the field. It may be a short series of angles at the edge of the horizontal axis of the field or inclined. Moreover, it may extend in the manner described as that of the progressive spectrum, but, instead of progressing in the upward curve, as does that described in the middle zone, this peripheral spectrum, if it extends, curves downwards, as in Bäck's curious figures. These also illustrate the tendency for such spectra to occur, in a similar manner, sometimes at one and sometimes on the other side, in corresponding form. His figures also show the strong tendency to regard a spectrum which appears in the periphery of the field to be at the extreme edge, even when it is so far from the edge as to permit of some further extension. You will also observe in Bäck's drawing of what he regarded as the elementary forms of his "phenomenon," he represents a small lateral spectrum as attached to the outer junction of the eyelids. In one case an oblique lateral angled spectrum was drawn by the patient as commencing just within and extending beyond the limit of the field. It is clear that, even at the inner part of the peripheral zone, the spectrum seen seems as if it were quite at the margin of the field.

I have only touched upon the margin of the subject of this lecture. My hope is that this may serve as a beginning, that it may serve as a nucleus around which facts may gather, carefully recorded, carefully scrutinised, carefully sifted, and carefully classified. Only by such a collection of facts and observations, with discernment of the weight of correspondence, can come, in time, any real knowledge regarding them. Alas, I must end, as I began, in ignorance, content if I have made you share my own perception of it. The knowledge of the way in which these spectra are produced, if time shall bring it, may bring us increased power to control not only them, but all of which they are the prelude. If I have opened the path for their systematic study I shall be more than content.

THE SOCIETY OF MEDICAL PHONOGRAPHERS.—

Dr. Gowers has been elected President of the Society of Medical Phonographers, and will give an address on Writing and Short Writing in relation to Medical Work at an inaugural meeting of the society, to be held at 20 Hanover-square, London, on Tuesday, July 30th, at 4 p.m. The meeting will be open to any member of the profession who desires to attend. The society now numbers 160 persons.

THE DERMATOLOGICAL SOCIETY OF GREAT BRITAIN AND IRELAND.—The annual general meeting and congress was held on May 30th at 20, Hanover-square, W., Dr. Pye-Smith, F.R.S., President, being in the chair. After the presidential address, the secretary (Dr. Stowers) and the treasurer (Mr. Alfred Cooper) read their reports, indicating the increasing prosperity of the society and its satisfactory financial condition respectively. It was unanimously resolved that in future the meetings should be held on the fourth Wednesday in the month instead of the second Thursday as heretofore. Dr. H. Radcliffe Crocker read a paper entitled "The Internal Therapeutics of Psoriasis and some other Diseases of the Skin," followed by a discussion, in which the President, Dr. Liveing, Dr. Stephen Mackenzie, Dr. Bowles, Dr. Payne, Mr. William Anderson, Dr. Brooke (Manchester), Dr. Abraham, Dr. Walsh, Dr. Harrison Cuffton, and Dr. Mackey (Brighton) took part.

THE DIET OF TOIL.¹

By THOMAS OLIVER, M.D. GLASG., F.R.C.P. LOND.,
PROFESSOR OF PHYSIOLOGY, UNIVERSITY OF DURHAM; AND PHYSICIAN
TO THE ROYAL INFIRMARY, NEWCASTLE-UPON-TYNE.

In a paper which deals with the alimentation of the labouring classes perfect accuracy is scarcely possible. Great difficulty is experienced in obtaining reliable facts; working men do not readily impart the information asked for. To medical friends in various parts of the country I sent schedules with a series of queries tabulated—e.g., nature of employment, hours of labour, wages, how many children to support, enumeration of articles of diet at each meal, and the quantity of each approximately stated. Most of the schedules have been returned. Upon this point I have to complain less of the hesitancy of the labouring classes than have the writers of the Memorandum in the Blue-book "Returns of Expenditure of Working Men, 1889," who only received thirty-six answers to 750 circulars distributed amongst members of coöperative boards. Perfect accuracy of the weight of articles partaken of at each meal is scarcely obtainable, and to that extent, therefore, the subject of the alimentation of labour cannot, in the following pages, be regarded as settled from the scientific point of view. The physiology of alimentation is fully dealt with in the various textbooks. I am not dealing at present with the weight of the individuals concerned, nor with their food incomes and expenditure. In most cases only an approximate estimate of the quantities of the articles of food has been gained, but, taking the large number of dietetic returns that have been made, a fair average can be struck and a fairly accurate opinion formed. The facts thus obtained are not only useful, but interesting. Taking "standard diets" that have been worked out by physiologists for people in health during rest, also during medium and active work, I will compare the results. For a man weighing 70 kilogrammes—i.e., 11 st.—it is necessary that 700 grammes, or nearly 25 oz. avoirdupois, of solid food should be taken daily. This is distributed by physiologists² amongst (1) proteids or albuminous substances such as animal food, eggs, and milk; (2) fats; (3) carbohydrates—e.g., potatoes and starchy foods; and (4) salts, thus:—

Proteid.	Fat.	Carbohydrate.	Salts.
140	105	420	35

This is a liberal diet, especially as regards proteid.

During medium work the following are the standard diets:—

	Proteid.	Fat.	Carbohydrate.	Salts.
Moleschott	138	84	404	30
Pettenkofer and Voit	137	117	382	30

During severe work:—

	Proteid.	Fat.	Carbohydrate.	Salts.
Moleschott	140	90	434	32
Banke	100	100	240	25

And during very laborious work:—

	Proteid.	Fat.	Carbohydrate.	Salts.
Smith and Playfair	184	71	570	40

A glance at the above shows that there is a considerable discrepancy between physiologists as regards the qualitative and quantitative composition of diet in health. Into the question of a "subsistence diet" I need hardly enter. Calculated as it is upon the internal needs of the organism, it has only a physiological interest. It is reproduced in the following table simply for the sake of comparison. It is insufficient for a man in health. Under its use emaciation would be quickly progressive. In considering the diet of rest it must be remembered that no active exercise is taken.

A subsistence diet:—

	Proteid.	Fat.	Carbohydrate.
Smith and Playfair	66	24	330

Diet of rest:—

	Proteid.	Fat.	Carbohydrate.
Smith and Playfair	100	50	400
Voit and Pettenkofer	137	72	352

Of all the diets thus enumerated, that of Moleschott, for medium work, is generally regarded as the best average diet for an adult man. It is necessary to remember that for every kilogramme of body weight there should be 2 grammes of proteid, 1.5 grammes of fat, 6 grammes of carbohydrate, and 0.5 gramme of salts—in all, about

¹ Part of this paper appeared in the *Fortnightly Review*, October, 1894, and is reproduced by permission.

² Waller's Physiology, p. 263.

10 grammes, or 1 per cent. of solid food. It is the carbon and nitrogenous elements in our food that undergo metabolism in the body. The materials ingested may therefore be regarded as so much carbon, nitrogen, hydrogen, and salts. In 100 grammes of proteid there are 53 of carbon, 16.1 of nitrogen, and 7.1 of hydrogen; in the same quantity of fat there are 76.5 of carbon and 10.9 of hydrogen; whilst in carbohydrate there are 44 of carbon.³ Converting Moleschott's diet into terms of carbon and nitrogen, we get of nitrogen 20.9 grammes, carbon 307, and hydrogen 11.6. Roughly speaking, an average diet ought to contain in the form of food stuffs 20 grammes of nitrogen and 300 of carbon. One of nitrogen to 15 of carbon is regarded as the desirable proportion.⁴ Hence, in combining meat (1-5) with bread (1-22) we get what forms the foundation of a good prosperity diet for all. In order to complete the diet fat should be added. A foundation day's diet, according to Waller, is—

	C.	N.
	Grammes.	Grammes.
Bread, 1 lb. (450 grammes) ...	117	5.5
Meat, $\frac{1}{2}$ lb. (225 grammes) ...	34	7.5
Total ...	151	13.0
And if fat is added—say, $\frac{1}{2}$ lb. (bacon, butter), viz. ...	84	—
We have a total for the day of ...	235	13.0

As an illustration of a fundamental English diet we may take the following:—

	C.	N.
	Grammes.	Grammes.
Foundation—1 lb. bread ...	117	5.5
$\frac{1}{2}$ lb. meat ...	34	7.5
$\frac{1}{2}$ lb. fat ...	84	—
Accessories—1 lb. potatoes ...	45	1.3
$\frac{1}{2}$ pint milk ...	20	1.7
$\frac{1}{2}$ lb. eggs ...	15	2.0
$\frac{1}{2}$ lb. cheese ...	20	3.0
	335	21.0

A liberal diet, and the cost of which is about a shilling.

In order to obtain a general idea of the quantity of the various articles presented to an adult man at his meals I got one of the nurses in the medical ward of the Newcastle Infirmary to weigh the contents of a few of the platefuls given to convalescent patients, and this is her average: a slice of a 4-lb loaf, $\frac{1}{2}$ to 1 in. in thickness, weighs 2½ oz., or 70.87 grammes; an ordinary plateful of meat without bone weighs 4½ oz., or 127.54 grammes; and an ordinary plateful, or three medium-sized potatoes, weighs 8 oz., or 225 grammes. One ounce of butter was sufficient to cover three to four slices of bread. In contrasting the dietaries of those engaged in the various industries, we shall begin with the agricultural labourer. The agricultural labourers of Scotland are, as a class, healthy and temperate; they receive small wages. The wages of the Irish agricultural labourer are smaller than those of the English or Scotch, and his dietary is altogether poorer. Living, as many of them do, upon Indian meal mixed with white flour, potatoes, and tea, and seldom partaking of animal food, we have an explanation of their inability to compete in muscular effort with the Englishman and of their liability to contract low fever. Potatoes still form the staple diet of the Irish peasant, and whilst, to a certain extent, these are capable of replacing bread and butter, and are rich in carbon, they are extremely poor in nitrogen. In the 10 lb. of potatoes consumed daily by an Irish labourer there would be 450 grammes of carbon and 17 of nitrogen; but notwithstanding this he would be ill-fed and would require fat. I will give illustrations of the dietaries supplied to me in every instance from authentic sources.

TABLE I.—*English Agricultural Labourers.*
(Data supplied by Mr. Theodore Cookson, J.P., Sturford Mead, Warminster.)

No. 1, aged thirty-three years; wages, 13s. 9d. per week; no children; house rent, £4 10s. a year; works ten hours a day.

No. 2, aged forty-two years; has six children, three of

³ According to Ranke fat contains 79 per cent. of carbon and carbohydrate—e.g., starch—37 of carbon.

⁴ Where an analysis of food is supplied, but only nitrogen is mentioned, then, in order to express this in terms of proteid, it is necessary to multiply the amount of nitrogen by 6.5.

whom are working; wages, 14s. per week; works ten hours a day.

(No. 1.)	C.	N.
BREAKFAST—	Grammes.	Grammes.
1 pint tea (with sugar) ...	12.0	—
6 oz. bread ...	43.8	2.1
$\frac{1}{2}$ lb. bacon ...	82.0	0.4
1 egg ...	7.5	1.0
DINNER—		
$\frac{1}{2}$ lb. potatoes ...	22.5	0.6
$\frac{1}{2}$ lb. bacon ...	82.0	0.4
Very occasionally meat ...	—	—
2 oz. cheese ...	2.0	3.0

TEA—		
1 pint tea ...	12.0	—
4 oz. bread ...	29.2	1.3
SUPPER—		
2 oz. cheese ...	20.0	3.0
2 oz. bread ...	14.7	0.6
	374.9	13.7

A fairly good diet, but deficient in nitrogenous material.

(No. 2.)	C.	N.
BREAKFAST—	Grammes.	Grammes.
1 pint of tea ...	12.0	—
8 oz. bread ...	58.4	2.6
6 oz. bacon ...	123.0	0.6
DINNER—		
12 oz. potatoes ...	32.7	0.9
1 pint tea ...	12.0	—
4 oz. bread ...	29.2	1.3
TEA—		
8 oz. bread ...	58.4	2.6
Tea ...	12.0	—
$\frac{1}{2}$ oz. butter ...	10.0	—
	348.7	8.0

Very poor in nitrogenous material.

When the English agricultural labourer has no children he is apparently able to feed pretty well. He consumes large quantities of carbon, principally in the form of fat. He eats largely of bread and cheese. In his garden or allotment he raises a sufficient supply of potatoes and vegetables for his family. On the necessities of life and house rent he spends 67 per cent. of his wages. The diet of an Ayrshire ploughman (facts per Dr. Wylie) is as follows:—

TABLE II.—*Ayrshire Ploughman (No. 3).*

Aged fifty, has five children, none working; wages, 15s. a week, free house; hours of labour, twelve.

	C.	N.
BREAKFAST—	Grammes.	Grammes.
Porridge ($\frac{1}{2}$ lb. oatmeal) ...	99.6	4.4
$\frac{1}{2}$ pint milk ...	20.0	1.7
DINNER—		
Broth ...	(?) 10.0	0.6
$\frac{1}{2}$ lb. meat ...	34.0	7.5
$\frac{1}{2}$ lb. potatoes ...	33.7	0.9
TEA—		
Porridge ...	99.6	4.4
$\frac{1}{2}$ pint milk ...	20.0	1.7
$\frac{1}{2}$ pint tea ...	6.0	—
4 oz. bread ...	29.2	1.3
$\frac{1}{2}$ oz. butter ...	10.0	—
	362.1	22.5

An excellent diet for a man who is doing hard work and spending most of his time in the open air. According to his wife's statement 80 per cent. of the wages is spent upon food.

Agricultural Labourer, Island of Coll, N.B. (No. 4).

Wages, 12s. Has seven children; two at farm service. Rent of house £3 a year. Works ten to eleven hours a day. Data supplied by Mr. Smith, Coll.

The following note on the Irish peasantry is supplied by the Rev. Father Lawton, Killorglin: "The dietary of the labouring classes has greatly improved these latter years. Flour is exceedingly cheap, and the poorest have mixed bread—i.e., half flour and Indian meal^{*}—for breakfast and supper; potatoes and milk for dinner, with salt fish occasionally, and American pork at least once a month. Tea is used by all classes for breakfast, and the old people use it also for supper. Farmers give their servants a better scale of dietary: flour bread for breakfast, and meat with cabbage twice a week for dinner." In another private letter from Mr. Walker of Glenbigh I am told: "Their food is principally milk and bread made of Indian meal and flour morning and evening, and milk and potatoes in the middle of the day. The very poorest of the people somehow manage to keep a Kerry cow or two, and have sufficient

^{*} Indian meal contains a smaller percentage of nitrogen and carbon than wheaten flour, but the difference is only 3 per cent.

land, such as it is, to grow a sufficient supply of potatoes and cabbages."

Deficient in nitrogen.

As it is upon the proteid or nitrogenous elements in food that the greatest value is placed as an article of diet, I observe that the Scotch farm labourer and the shepherd are the best fed of all the agricultural labourers, and, so far as the consumption of bread, oatmeal, and potatoes is concerned, the Scotchman gets most for his money, the Irishman the least. Of all the agricultural labourers, the Scotch are the best fed.

In dealing with the feeding of coal miners I have deemed it advisable to obtain statistics from different collieries in Northumberland and Durham.

TABLE V.—*Coal Miners.*

(Facts supplied by Dr. Messer, Lemington-on-Tyne, Dr. Blair, Ashington, and Mr. Colquhoun, Spen.)

A hewer, earning 55s. a week; one child not working; rent of house, £10 a year; six hours' labour; can save money; is temperate.

Is underfed; diet is deficient in both carbon and nitrogen.

It may be said of coal miners, as a class, that they feed well, and that they believe in the necessity of taking every day a fairly large quantity of animal food, particularly beef.

Compared to the dietary of the collier, that of the English navy stands out remarkably well. At present, the North-Eastern Railway Company is widening its line a few miles from Newcastle. Many of the navvies live in Felling-on-Tyne, and thus I have been able to obtain, through Mr. Thomson of Felling, an authentic statement as to the character and quantity of their food.

TABLE VII.—*English Navy (No. 12).*

Vegetables—cabbage	(?) 6 4	0 5
2 pints beer per diem	28 0	0 8
	380 9	27 6

His average purchases for the week are 6½ lb. beef, 4 small loaves, 1½ lb. sugar, 1 quart milk, 12 eggs, ½ lb. butter, 1 lb. cheese, 2 or 3 lb. ham, and ½ stone potatoes. As potato-eaters navvies vary; some consume as much as a stone of potatoes in the week.

In the case of iron and steel workers we have a body of men whose work is hard and whose wages are good. By this means they are able to procure substantial food, and when temperate can save out of their wages. The facts as to dietary have been supplied to me by Dr. Messer of Lemington-on-Tyne.

TABLE VIII.—*Iron and Steel Workers (No. 13).*

The steel grinders, as a class, are apparently small nitrogen consumers. Their work is not hard.

It is amongst female lead workers that we find the dietary reduced to almost a starvation level; not so much on account of the wages they receive, but due to the fact that they are generally the breadwinners of the family. Many of them are widows, with a family to support; others are married, and their husbands are either out of work or indolent.

CASE 4.—A woman aged eighteen years, suffering from lead colic; the father generally was out of employment; the mother sells fish, and makes about 5s. 6d. a week. The patient's own earnings are from 9s. to 10s. a week.

If it is necessary that an adequate food allowance should contain 300 grammes of carbon and 20 grammes of nitrogen, the dietary of the female lead worker contrasts badly. If the diet of needlewomen in the East-end of London be spoken of as a "starvation diet" when it contains 200 grammes of carbon, and 9 of nitrogen, the bill of fare of a female lead worker is a sad illustration of how body and soul have to be kept together on the lowest amount of food possible. In the scanty feeding of these women and their inability to take food lies one of the principal reasons why they so soon become a prey to the metallic poison. It has been demonstrated that if a proper supply of food be taken, and particularly before commencing work in the morning, the chances of plumbism developing are diminished. Dangerous as working in a white-lead factory may be, it is doubtless poverty and bad feeding that predispose the operative to succumb to the effects of lead, and if there is one thing that may be regarded as the best preventive it is employers of labour giving to their "hands," before commencing work, breakfast consisting of either warm milk and bread, or coffee with milk and bread and butter.

The textile industries resemble each other in so far as the labour is nearly all done by machinery, and the work of the operative, therefore, is simply to tend two or three machines. The work is carried on in large rooms, frequently overheated, and at times not too well ventilated. In some of the factories, where very fine spinning is done, the atmosphere is not only too warm, but it is too moist. The cotton-spinners of Lancashire are, as a class, well paid and well fed. Both the men and women are pale through working in the overheated rooms. Take, as a typical case, the following dietary of an unmarried female cotton weaver, supplied by Dr. Garner, Preston, to whom I am indebted for much of the above information:—

TABLE XIV.—Workers in the Cotton Factories.—A Female Weaver (No. 25).

This is one of the best samples of a cotton weaver's diet. The operative in question has an exceedingly comfortable home, being one of three daughters, all working; goes home for dinner.

Cheese	13 0	2 0
	245 6	17 0

This is slightly above the average female dietary, and if we add to it one-fourth of total diet for the day we get the average for male cotton-spinners—viz., 333 grammes of carbon and 24 of nitrogen; but as fish would not be taken every night for tea the dietaries would stand thus: 252 6 grammes of carbon and 15 2 nitrogen for the female; 315 carbon and 19 grammes of nitrogen for the male.

As opposed to this, take the case of a single woman aged twenty-six years, who is suffering from incipient phthisis, but is yet following her occupation. Her wages are 14s. to 18s. a week, and the rent of her house is 4s. 6d.

The men engaged in the woollen industries in and around Bradford apparently feed well. Their hours of labour vary from ten to ten and a half a day, their wages from 18s. to 32s. a week, and their house rent from 3s. to 4s. 6d. Dr. Hunter of Pudsey tells me that "as a class the spinners and weavers are exceedingly temperate and save a fair amount of their wages, which they either deposit in the bank, spend on fine clothes, or in frequent excursions and holiday-making."

TABLE XVI.—*Workers in Wool Factories (No. 28).*

Treacle is largely used by the woollen spinners, also by the cotton operatives. As it contains a good deal of saccharine matter it is extremely nutritious.

From the Bradford Infirmary Reports I observe that the diseases which affect the woollen industries are similar to those met with amongst the cotton operatives. Of the general diseases, the most frequent is anemia affecting women, and next to this pulmonary complaints and nervous diseases. Opposed to these various tables of the diet of toil I shall place two starvation diets which have come under my own observation.

TABLE XVII.—*Starvation Diets.*

CASE 1.—A man was admitted into the Newcastle Infirmary, under my care, suffering from a purpuric rash on the skin

and commencing phthisis. His wages had been 9d. a day, or 5s. 3d. a week; he paid for his room 4d. a day, or 2s. 4d. a week, leaving him, therefore, with only 2s. 11d. a week to live upon. He took two meals daily, but had no great appetite; was temperate. From January to June, 1894, he only once ate potatoes and green vegetables.

	114.4	3.0

As the average daily output of a man weighing 70 kilogrammes or 11 st. is 230 grammes of carbon and 15 of nitrogen, it is clear that if his health and bodily weight are to be maintained his daily diet must contain these elements in the proportion mentioned. But for the maintenance of nitrogenous equilibrium it is not required that the loss of nitrogen from the system should just be balanced. If nitrogen is not sufficiently supplied in the food it will still continue to be eliminated, its source being the metabolism of the tissues that contain it. The nitrogen import has to be considerable in order that the equilibrium may be maintained—viz., three times the amount of nitrogen excreted when no food is taken. The channels by which this element leaves our body are the kidneys, intestine, lungs, and skin; nearly the whole of it comes away by the kidneys in the form of urea, so that the quantity of urea eliminated is taken as the measure of nitrogenous dissimilation of the system. Thirty grammes or 500 grains of urea are regarded as the normal daily amount, and in 30 grammes of urea there are 14 of nitrogen. Add to this the quantity that leaves by the intestine—viz., 10 per cent. of the total nitrogen eliminated—and we have an accurate statement as to the daily nitrogen export, for the amount discharged by the lung in the form of ammonia in the expired air is infinitesimal, and the same remark applies to escape by the skin. What we recognise as a result of examination of the diet tables of the industries is that, with few exceptions, the individuals are not taking in their food that excess of proteid or animal food necessary to maintain their nitrogenous equilibrium; also, that poor people when long underfed become accommodated to a low minimum, and that health seems even for a time to be thus well maintained, although, in many of the cases tabulated, where the nitrogen import was for a lengthened period at a minimum the individuals, to my knowledge, subsequently became the subjects of tuberculous disease.

Ellison-place, Newcastle-upon-Tyne.
C C 2

ON THE MICRO-ORGANISM OF CANCER.

By JAMES BRAITHWAITE, M.D. LOND.,

OBSTETRIC PHYSICIAN AND SURGEON TO THE LEEDS GENERAL INFIRMARY; EDITOR OF THE "RETROSPECT OF MEDICINE," ETC.

ALTHOUGH I have left my mind open on the question I have never believed in the existence of a micro-organism as the cause of cancer until I recently had the opportunity of watching the rapid spread at its edge of a very superficial epithelioma on the vulvar mucous membrane. The activity seemed to be chiefly at the margin of the disease, and its appearance and almost daily invasion of fresh territory convinced me that some infective agency must be at work. The border of the disease was not only brighter in colour than the centre, but it was more raised and appreciable to the touch; the disease, moreover, increased not by the old part growing, but by the invasion of apparently healthy epithelium, which by mere contact became diseased; in fact, it somewhat resembled a ringworm, but was undoubtedly malignant. A second case also confirmed me in the idea of the active operation of a micro-organism; this was a minute rodent ulcer on the cheek with a circular depressed surface, having clear-cut edges or walls. The depressed surface was carefully watched by the patient, a highly intelligent woman, and a powerful hand lens showed that some volcanic action was going on in the little crater. A small cone would rise on the surface and apparently open at the summit by a minute pore, and discharge something (so she thought), and then subside, the whole cone formation and subsidence occupying one or two days. That this was a small rodent cancer was proved by its microscopic examination after removal. Reflecting upon these cases, and also upon the remarkable discovery by Mr. Haviland that cancer exists endemically in populations living upon low-lying moist soils and in certain "cancer-houses," the conclusion seemed highly probable that the micro-organism must be a fungus, and not, as supposed, a bacterium, coccidium, or protozoon. There is a very large Jewish population in Leeds, probably about 10,000, the female portion of which is constantly seen at the out-patient department of the Leeds Infirmary. In not one Jewess have I ever met with cancer of the genital organs, whereas it is extremely common amongst the Christian women, the inference being (assuming it to be a micro-organism) that it is introduced or not introduced by the husband, according to his faith. Microscopic examination of the secretion frequently contained within the prepuce was the next step, with a very suspicious, but not absolutely certain, result. Some spores were found and two minute loops of mycelium identical in appearance with that to be described. I have since this examined epitheliomata taken from the ear, the uterus, the breast, the lip, and the penis, and in all five I have without any difficulty demonstrated the existence of a fungus, the same in all cases. (I have also examined a melanotic sarcoma, but the description of this I will leave until later.) The fungus has been seen and examined by a large number of students, qualified residents at the Leeds General Infirmary, medical men in practice, and by some of my own colleagues, and none have had any hesitation in admitting its existence. The mode of preparation is as follows. Whether the preparation is an old one in spirit, or whether it is quite fresh, cut out a very small block from the centre, but in the case of cancer of the lip the free margin should be included. If fresh and not convenient to examine at once place in dilute spirit for the night. Next day make as fine sections as possible in the usual way and place them in water. Float off two or three of the best on to slides and drain off as much water as possible. Place upon each three or four drops of liquor potassæ and put them aside protected from dust, to stand for from twenty minutes to four hours, according to the opacity or thickness of the section. When the section appears pretty transparent wash away the liquor potassæ with water without displacing the section. This must be thoroughly done. Then mount in Farrant. If it is merely wished to examine quickly without preservation of the section put on a drop of liquor potassæ and then the cover-glass. The section will improve for two hours, or if a fresh growth for even four hours, and will then slowly fade. This plan, however, is the best at first, for the idea derived is clearer, as

the mycelium comes out gradually and more distinctly and at last but little else is seen. This plan is founded upon the fact that the fungus, with its mycelium, spores, and spore bags, resists the potash longer than the tissues proper. If the action of the potash is not sufficient, the yellow elastic tissue presents a similar appearance to the mycelium. It is, however, larger, coarser, and straighter, and is also sometimes branched, which the mycelium never is. In cancer on the lip it is very important to use the potash long enough. If now the section is held up to the light it will be seen to be very transparent and almost invisible, but here and there small whitish portions are seen. These contain the fungus in the greatest amount. Under a $\frac{1}{2}$ in. objective larger or smaller quantities of extremely fine colourless mycelium are seen. The delicate fibres are rounded, not flat or jointed. They are often contorted and curved so as to form masses of loops. In the epithelioma of the lip the mycelium was especially abundant at the free surface of the sore. It will take no dye, and, indeed, none is required, its great refracting power making it stand out clear and distinct in outline. Any attempt at dyeing makes it all but invisible. Numerous solitary spores and also the mycelium was found in all the five specimens. In the epithelioma from the auditory meatus (papilloma?) there were also spore masses not contained in an envelope or wall; these were of irregular shape. In the uterine cancer was seen a spore mass emitting mycelium (see H in drawing).

FIG. 1.

A, Primary spores. B, Two spores approach and contiguous sides flatten. C, A tube is projected from one which sucks in the other. D, The commoner mode of conjunction, ending, as does C, in the formation of zygosporangia (c 1; d 1, 2, 3). E, Conjugation of more than two spores to form spore masses. F, Complete spore mass in envelope or cell membrane; I have called these "spore bags." G, Splitting of spore bag and exit of mycelium. H, Same from the uterine cancer. I, One (the only one seen) emitting mycelium from both ends. J, Spent spore bags. K, Mycelium from the lip cancer at edge of sore.

In the breast cancer the greater part of the life of the fungus could be studied. This breast had been amputated on May 24th and had been placed in a bowl of water with the tap gently running over it for four days. The disease had not penetrated the skin, which up to the time of operation was intact. One deep incision had been made three-quarters through the large mass. A small block was cut from a part of the tumour about two inches deep. One of the sections happened to contain the fungus alive, and it went through most of its life on the slide (in the Farrant), the hour's immersion in potash not having killed it. Its life in the four or five stages of its existence is as follows. To begin with, it is a spore mass. This when perfect has a delicate envelope and contains not a number of separate spores, but a fused mass of spores having a granular appearance externally (see F). This spore mass opens or splits at one side and becomes the shape of a shallow tea cup with a wide mouth. From this grows the mycelium, which penetrates in every direction (see G and H). One spore mass only was seen emitting mycelium from both ends (see I); the growth of mycelium could be noted by the eye, but seemed to have ceased on the evening of May 30th. The slide was then placed in the cabinet for the night, and next day not a trace of mycelium could be found, but the slide was one mass of spores, which certainly were not there the day before. These were evenly distributed over the slide. I have spent much time in watching these no doubt living spores with intense interest. The process of what is called conjugation had been and was to some extent still going on, until it was stopped by the density of the Farrant's jelly, but the whole process

could be seen, and can still, for the slide is yet in good condition. The process appears to be as follows. Two spores approach each other and become flattened at the contiguous sides (see B). From one of these a minute tube soon joins them (see C), and the contents of one spore are sucked into the other, which consequently becomes larger. This would be what is known as a zygospore (see C, 1; D, 1, 2, 3); it is probable that this mode of conjugation only occurs when from some reason the spores cannot actually touch. A commoner mode of conjugation is for two spores actually in contact to become fused into one, all trace of their dual origin vanishing. Similarly, three or four may be so fused, some traces of their compound origin in this case remaining. Not infrequently a considerable number (such as ten or twenty) become fused into one large spore mass (see E). The next step (but this has not been actually seen) is for such a mass to be enclosed in a fine enveloping membrane forming the complete spore bag, with which this description of the life of the fungus began. When the spore bag is exhausted it presents the appearance as seen at J. The life of the fungus, therefore, seems to consist of four stages—namely, (1) spores; (2) zygospores; (3) spore masses and spore bags; and (4) mycelium which is emitted from the ruptured spore bags. This mycelium gives origin to the spores. This must be the case, but it has not been actually seen.

FIG. 2.

Section of melanotic sarcoma, with very low power, showing the spore bags, most of them empty, visible to the naked eye.

FIG. 3.

A few spore bags highly magnified, some empty, with mycelium and spores.

To recapitulate, the only parts of the process which have not been actually seen are the formation of the membranous covering of the spore bag, and the formation of the spores in the mycelium. It may be asked, "Have you introduced the fungus by means of the instruments used?" This cannot be so, for the fungus in the uterine cancer was found within half an hour of its removal in my own house, and it permeated the whole mass. The epithelioma of the lip was removed by Mr. Mayo Robson at the Leeds General Infirmary on May 30th, and was examined next morning. The papilloma of the external auditory meatus was removed by Mr. Secker Walker while I was present at a house within a hundred yards of my own, and was placed in Muller's solution immediately. The epithelioma of the penis was removed at the infirmary by Mr. Walter Brown on May 20th, and had been kept from that time in spirit, and was never placed in Muller's solution, so that in all the cases there were different operators and different instruments and different localities, with the exception that two of the specimens came from the infirmary. Examination was made either immediately or next day. The cancer in the breast, however, had been removed four days, and its treatment has been already described. I may now describe the sixth specimen, which had been kept in spirits nineteen months in the pathological room of the infirmary and was labeled "Melanotic Sarcoma." Microscopic examination of this proved the correctness of the title. This was found to be full

of mycelium and spores. The mycelium precisely resembled that met with in the epithelioma. Here, however, the resemblance ceased, for there were large masses of spore bags containing as many as 50 to 200 bags each, at least twice the size of the spore bags of epithelioma, and they were egg-shaped instead of round. They readily ruptured, giving exit to the spores, which were of a blackish colour and leaving the empty bags *in situ*. These masses were so large and numerous that they could be seen with the naked eye. It is not likely that this fungus is the same as that of epithelioma assuming another form, as the spores are blackish in colour, and it must be noted that this was not true sarcoma but melanotic sarcoma. No doubt it will be asked whether I assert that this or these micro-organisms are the causes of cancer and sarcoma. No; I do not positively assert this, but I believe it to be the case, for it cannot be a mere accident or coincidence that a fungus was present in every one of the six specimens and in considerable amount. There can be no question whatever as to its existence, and if anyone doubting it could see the sections in my possession he would be convinced immediately. If anyone would care to refer to the Transactions of the Obstetrical Society of London for 1882¹ he will find the report of a case of non-capsulated fibroid within the uterus, in which a fungus was found by me in a large amount, but it was not the same fungus as that of epithelioma or that of melanotic sarcoma, so that this discovery to a certain extent naturally sprang out of that. I have also lately found a few spores, but no mycelium in the growing base of a mucous polypus of the cervix uteri, also in that of a fibroid polypus, and in a uterine fibroid weighing ten pounds, which I removed a short time ago by abdominal section. These may have been accidentally introduced, but in the mucous polypus they seemed to be regularly arranged in the tissues. I will therefore hazard the conjecture, but it is a mere guess, that many other forms of tumour will be found to have a fungoid origin. In this case the theory which I published a few years ago in THE LANCET² will explain why some of them are malignant and some are not, and just as it appears probable that one fungus affects only epithelium and causes true cancer, and that another affects only mesoplastic tissues and produces sarcoma, so it will be found that each form of tumour has its own fungus. It is probable that the fungus of ordinary sarcoma is not exactly identical with that described in the account of the specimen of melanotic sarcoma. Much, of course, is yet wanting to prove the case absolutely, but the cultivation of the fungus under direct observation in Farrant is very easy, and probably it would be easier still in some form of jelly containing no antiseptic and of more fluid consistence, so as to allow of movement of the spores. It is almost evident that the primary spores are sterile, also no mycelium has been seen to emanate from zygospores, but they are presumably fertile under some condition or other. The spore bags are undoubtedly very fertile, and must be present so far as can be seen at present for any successful cultivation. It is also not unlikely that mycelium in order to produce spores must maintain its connexion with its nourishing spore bag, and if so mycelium alone would be sterile.

Next arises the natural question, Is any practical result likely to result from this discovery if it should prove after the careful investigation it will doubtless receive that it is the real explanation of the cause of malignant growth? So far as I can see at present the answer may be given as follows: 1. The cure of a cancerous growth actually in existence does not seem more probable but less probable, because the enemy is so subtle, so penetrating, and so indestructible (proved by immersion in liquor potassæ for an hour not killing it) that it almost seems impossible to eradicate it; it is, however, better to have an enemy exposed to view than one invisible. But it seems likely that after removal of a growth by operation it would be better not to close the wound absolutely, but to keep the surface in contact with dressings soaked in glycerine containing liquefied carbolic acid and also perchloride of mercury (the carbolic acid partly to relieve pain). Glycerine penetrates tissues and carries with it any substance in solution. It seems not improbable that cancer of the breast may be altogether prevented in women past the child-bearing period by merely closing the orifices of the milk ducts in the nipple by a small surgical operation or by the use of a fine electric cauter, for the fungus must enter the breast *via* the milk

¹ Vol. xxii., p. 182.

² THE LANCET, JUN. 30th, 1888.

duct orifices. 3. It is possible that we may have to return to a certain Mosaic rite in order to save our wives from uterine cancer, unless the daily use of soap will do away with this necessity. 4. In order to prevent the fearful mortality from cancer in low-lying wet soil districts the bodies of persons dying from cancer must be specially buried at a great depth or they must be cremated. It will be seen that moisture is absolutely necessary for the formation of zygospores, spore masses, and spore-bearing mycelium. It does not seem probable that the fungus necessarily spends part of its life in the earth, but no doubt when the interment is at no great depth the earth will become infiltrated, if it is constantly wet, and floods will carry the spore masses all over the country. 5. A fungus can only attack effete tissues. We are ourselves only tools of nature; we must keep ourselves bright by constant use; we must not rust from luxury and idleness. Business men must be careful how they retire, for, just as tuberculosis is favoured by excessive work and poor food, so the growth of a fungus is likely to be favoured by the effete materials present in the system engendered by the opposite conditions. We cannot, however, foretell what may be the result of this discovery, if discovery it is. Some remedy may be found which will destroy the fungus. I will now leave the matter to the judgment of my professional brethren. It is certain to excite great interest and many divergent opinions, for is not cancer the most terrible scourge to the human race which exists? The mere dread of it has been known to unhinge the mind, increasing as it is in frequency, and producing an amount of misery which no pen can describe.

Addendum.—Since this paper was written I have, by means of an able working pathologist who has been engaged for several years in a small pathological laboratory in my own house, made over 150 slide preparations of malignant and other healthy(?) and diseased tissue, and have come upon unexpected and startling results, which not only confirm most of what is already published in this paper—for in not one primary malignant case was the fungus absent—but render it highly probable that other diseases, and amongst them diabetes, are caused by fungi. I have also worked out rather more completely the life-history of the fungi of epithelioma and of sarcoma, and propose, with the kind permission of the Editors of THE LANCET, to describe these further results in a subsequent paper. Meanwhile, and until this is done, I shall be grateful if criticism is withheld. It is extremely easy for anyone to satisfy himself as to the existence of the fungi, and it would be better for actual investigation to precede criticism.

Leeds.

THE TEACHINGS OF PROFESSOR E. FRANK- LAND'S REPORT ON METROPOLITAN WATER-SUPPLY, 1894.

By CHARLES PORTER, M.D. IREL., D.P.H. CAMB.,
M.R.C.S. ENG.,

MEDICAL OFFICER OF HEALTH FOR STOCKPORT.

THE latest addition to Professor E. Frankland's familiar series of annual reports to the Registrar-General on the quality of the water supplied by the metropolitan water companies presents features of special interest and suggestiveness.

By graphic representations of the monthly fluctuations of contained organic matter Professor Frankland demonstrates the marked inferiority in regard to chemical purity of the raw river waters utilised in 1894 as compared with those used in 1893, and once more alludes to (a) the chemical superiority of the water of the Lea over that of the Thames as a raw material, especially in times of flood; and (b) the greater chemical purity of the water of the Lea in its upper as compared with its lower reaches. A second diagram contrasts the organic purity of the raw Thames water at Hampton with that of the average filtered water as delivered in London, and in this connexion attention is again directed to the fact that water impounded in times of severe floods may most seriously affect the quality of the "supply as delivered" in the following month, even to the extent of making it

during that month of a worse quality from a chemical point of view than the raw river water passing the companies' works at the same time. Commenting upon this remarkable state of things, Professor Frankland in his 1893 report recommended the provision either of (a) some means of substituting the river for stored water whenever the chemical quality of the former is better than that of the latter, as roughly estimated by observations of the colour in a two-foot tube; or of (b) sufficient storage to tide over the longest floods. This, it will be remembered, was one of the two conditions (the other being efficient filtration) with which the late Royal Commission safeguarded their opinion that no danger exists of the spread of disease by the use of drinking water derived from the Thames and Lea. Large, though insufficient, storage capacity appears, however, in this particular (chemical) respect, to be distinctly more disadvantageous than a relatively small amount, for certain companies who possessed comparatively little provision of this kind were actually enabled, just after the floods of June and December, 1894, to deliver water of better quality than that supplied by the Chelsea Company, who, notwithstanding their much greater storage capacity, had obviously been unable to entirely exclude flood water and had been compelled to use it afterwards. On the other hand, as regards bacterial purity, the deliveries of the companies possessing least storage were, as might be expected, amongst the least satisfactory.

Judged by the relatively low proportion of carbon to nitrogen, the organic matter present in the waters was, as usual, found to be chiefly, if not entirely, of vegetable origin, the directly conflicting results in this respect formerly obtained by the water companies' chemists having proved to be due to an error in the method of analysis adopted by the latter. A further discrepancy in regard to the Chelsea Company's water is explained by the fact that the supposed samples of this water collected for the companies' chemists were really taken, inadvertently, from the New River Company's main. In regard to the softening of metropolitan water (both river and well), treatment with lime is regarded as the most economical method, unless it can be shown that less than one-eightieth of the total supply is used for washing, for it entails only about one-eightieth of the expense incurred by the private consumer in the shape of additional soap.

Believing with Professor Koch and with American observers at Lawrence, Mass., that efficient sand filtration is practically a perfect safeguard against the introduction of cholera and typhoid fever bacilli into drinking water, Professor Frankland attaches the highest hygienic importance to the bacterioscopic examination of river-derived drinking waters as the only trustworthy method by which their efficient filtration and bacterial purity can be ascertained. To facilitate such examination in the metropolis he advocates the establishment of small bacteriological laboratories at the various river-water intakes. It is to be hoped that the time is not far distant when such provision will form part of the equipment of all filtering works, so that (as is now the case in the metropolis) the engineer in charge may at once be informed when any filter is working unsatisfactorily, for, to quote Professor Koch, "it is the business of those in charge of the works to take care that the filtered water always satisfies bacteriological requirements."

The results of bacterioscopic examination of the unfiltered river waters used by the metropolitan companies in 1894 once more demonstrate (1) the immense destruction of bacteria which is effected by storage in subsidence reservoirs, and (2) that the bacterial quality of these waters may differ widely from their chemical qualities. Thus, the water pumped from the natural gravel-beds near the Thames is nearly identical chemically with the Thames water itself, but the bacterial purity of the gravel water far exceeds that of the Thames water, and, indeed, not infrequently that of the filtered Thames water sent into London. Again, although the water of the Lea was found during the year to be chemically purer than that of the Thames, and also in its higher as compared with its lower reaches, yet the determinations of 1894 have demonstrated that bacterially the higher portion of the Lea is enormously inferior to the lower portion and also to the Thames at Hampton. Professor Frankland specially draws the attention of the Lea Conservancy Board to this unexpected condition, and one naturally recalls the strictures of the late Royal Commission on the large heaps of gas-lime, manure, and town refuse which, as far as any rate as Hertford, "are placed on the edges of the banks [of the

Lea] and within a few feet of the stream itself," and which obviously in times of rain and flood become a serious source of pollution.

No part of this report will be read with greater interest than the observations recorded on the causes of the great variations in the amount of microbial life in river waters during the course of the year. Changes of temperature or exposure to varied amounts of direct sunshine have hitherto been regarded as responsible for these variations, the Royal Commissioners stating in their recent report that bacterial life is injuriously affected by "even such a tempered amount of light as is present under ordinary conditions in Thames water." Professor Frankland now, however, demonstrates that the amount of rainfall—or, in other words, the volume of water flowing in the river—is the chief cause of these variations. In a series of most interesting tables and diagrams he brings the number of microbes in raw Thames water into contrast with each of these alleged causes, and his conclusion is as follows: "That the number of microbes in Thames water is determined mainly by the rate of the flow of the river—or, in other words, by the rainfall—and but slightly, if at all, by either the presence or absence of sunshine, or a high or low temperature. With regard to the effect of sunshine, the interesting researches of Dr. Marshall Ward leave no doubt that this agent is a powerful germicide, but it is probable that the germicidal effect is greatly diminished, if not entirely prevented, when the solar rays have to pass through a comparatively thin stratum of water before they reach the living organisms. If this be so, however, it can be no matter of surprise that the effect of sunshine upon bacterial life in the great mass of Thames water should be nearly, if not quite, imperceptible." In regard to *filtered water*, if 100 microbes or their spores per c.c. be taken as the permissible limit of bacterial life, the effluents of the Chelsea, the West Middlesex, the Lambeth, and the New River Companies were almost uniformly of great bacterial purity. Never once throughout the entire year did the Chelsea filtered water exceed the above limit. The West Middlesex and the Lambeth both transgressed once (in January) and the New River Company twice (January and June). Ten samples of the Grand Junction Company's effluent (four from the Kew and six from the Hampton filters) exceeded the limit, the worst results (464 and 278 per c.c.) being in January and June. Four samples of the Southwark and Vauxhall Company's effluents, taken respectively in January, February, July, and December, were also unsatisfactory. The very small storage possessed by both of the two last-named companies is considered mainly responsible for these results. The East London Company's filters worked very irregularly up to, but not after, the end of July, and up to that time (except during May) there was always at least one unsatisfactory sample. Most of the foregoing abnormal results occurred when the raw river water was bacterially very impure.

The closing pages of the report are devoted to a *résumé* of the results hitherto obtained at the Lawrence (Mass.) Experimental Filtration Station, which are briefly: (1) that within the limits of 300,000 gallons to 3,000,000 gallons per acre per day, variations in the rate of filtration have practically no effect on the purity of the effluent, and that filters may be satisfactorily worked even at the rate of 5,000,000 gallons per acre per day, provided the uniform rate is maintained; (2) that, the finer the size of the sand grains between the limits 0.2 mm. and 0.9 mm. diameter, the higher the percentage of bacteria removed; (3) that with any moderate rate of filtration the depth of the sand within the limits of 1 ft. and 5 ft. exerts but little influence upon the percentage of bacteria removed; and (4) that scraping the surface of a sand filter does not interfere with bacterial efficiency, provided there is no mechanical disturbance of the main body of the sand. It is well known that Professor Koch has pointed out certain difficulties attending efficient filtration during times of frost, which he ascribes to (1) freezing of the superficial sand layer, causing at first total arrest of filtration and later excessively rapid filtration through the portions of the surface which are the first to thaw and become permeable, and (2) the impossibility of cleansing the sand surface of open filtering basins which have become thickly covered with ice. Professor Frankland, however, refers to, and reserves for future report, some entirely novel phenomena affecting filtration which the recent severe weather in England has brought to light, and the publication of his observations will be awaited with much interest.

Stockport, Cheshire.

A NOTE ON TWO CASES OF PUERPERAL ECLAMPSIA.

By ROBERT CRAIK, M.D. GLASG.

CASE 1.—A married woman, aged twenty-seven years had her first child in October, 1893. Labour was normal, delivery easy, and it was noticed that very little blood was lost with the placenta. Twenty-four hours after delivery she became strange, complained that she could not see, and had twitchings of the face and arms. When I arrived soon afterwards she had a convulsion lasting a few minutes, which left her unconscious, with noisy breathing. After a brief interval there was a second convulsion, general and very violent. Six ounces of blood were at once taken from the arm, and as the third convulsion came on (before the arm was tied up) chloroform was administered till she was fully under. A specimen of urine was drawn off and found to be highly albuminous; the ankles and face were seen to be distinctly oedematous. She was packed with hot bottles to encourage sweating, and one drachm of chloral was given per rectum. Although the patient was unconscious there was not another convulsion for about an hour. It was much less violent and lasted only a few minutes, during which a little chloroform was used. Five hours from the beginning of the attack there was still a slight convulsion from time to time, and another drachm of chloral was given as before, and one-third of a grain of morphia hypodermically. There was no convulsion after this, and, although the patient remained unconscious for six hours longer—about twelve hours in all—it was plain that she was improving. She perspired very profusely nearly all the time. She seemed to go on well for three days; then she had shiverings, her temperature went up to 105° F., and the vaginal discharge was found to be highly offensive. The uterus was scraped and douched with warm perchloride of mercury solution, and an iodoform bougie was left in. The douche was used night and morning till the temperature became normal, about thirty hours after the first douching. There was a good recovery in every respect, except that when I last saw her, a month after the commencement of the illness, there was still a trace of albumen in the urine.

CASE 2.—A married woman twenty-one years of age, robust and rather stout, who was in the eighth month of her first pregnancy, was suddenly seized with convulsions just as she was about to rise one morning. Very soon afterwards I found her semi-conscious and breathing noisily, and in a few minutes a very violent convulsion set in and lasted a considerable time. As soon as the convulsion began to pass off rather more than six ounces of blood were taken from the arm. Chloroform was then administered and delivery attempted. The os soon yielded sufficiently to the fingers to allow of turning. Delivery was easy, as the child was small. An average amount of blood was lost with the placenta, which came away without much trouble on compressing the uterus. The manipulations occupied an hour (during which she was under chloroform), and delivery was completed about an hour and a half after the patient was first seen. An intra-uterine douche of perchloride of mercury was given. Some urine was drawn off and found to be blood-coloured and highly albuminous. She was packed with hot bottles to encourage sweating, one drachm of chloral was given per rectum, and one-third of a grain of morphia hypodermically. There were no convulsions for two hours after delivery, but they then set in and continued to recur at intervals of about half an hour for the following twelve hours, with varying degrees of violence. Chloral was given (one drachm every two hours) per rectum till she had had rather more than half an ounce in all. After that, chloroform was used from time to time when the convulsions were very severe, but it was not pushed. Eighteen hours from the first onset of the convulsions the patient was lying quite unconscious, breathing rapidly, with a very weak and rapid pulse. Her feet and legs were much swollen, and her face was markedly oedematous. Not more than three or four ounces of urine had been drawn off in twelve hours, and she was not perspiring freely. She seemed to be in a dying state. An enema of beef-tea and brandy was given, one-third of a grain of pilocarpin in solution was dropped on the tongue, and the hot bottles were continued. After lying for three hours in a seemingly hopeless condition,

bathed in perspiration, the pulse began to improve. It now became possible to give hot strong tea by the mouth in tea-spoonfuls, and in this way half a pint was given in an hour. There was gradual improvement in the pulse, which became stronger and fell from nearly 200 to 120. Consciousness returned about thirty hours from the onset of the seizure, but there had been no convulsions during the last ten hours. Improvement was now all that could be desired for two days, and then she was found to have a temperature of 104° F. The vaginal discharge was very offensive, but there was not any marked tenderness of the abdomen. The uterus was scraped out, pure carbolic was applied to its inner surface, and then it was thoroughly irrigated with hot perchloride of mercury solution, and an iodoform bungle left in. Irrigation with hot perchloride was repeated night and morning, the temperature remaining above 103° for two days, and not reaching the normal for a week. There was a good recovery, and the albumen disappeared from the urine in a much shorter time than in the first, and less severe, case. At one time or another there were seen in this urine blood corpuscles, blood casts, and hyaline casts, yet it was apparently normal in a fortnight.

Remarks.—In these two cases, which called for treatment on the same day within a few hours of each other, a similar course was pursued, with similar results. The only difference, indeed, was that one-third of a grain of pilocarpin was given in the second and more severe case when it was at the worst, whereas no pilocarpin was given in the first case. In both cases septic poisoning occurred, and the use of the catheter, the hot packing, and perhaps some neglect of the discharge during the period of unconsciousness may have led to this. Each case had its own catheter, syringe, &c., and reasonable precautions were taken to avoid sepsis. As the high temperature lasted so long in the second case, there probably was septic metritis. Four other confinements attended during the same week had a normal recovery.

Conisborough, Yorks.

ABSCESS OF LUNG TREATED BY DRAINAGE AND IODOFORM; RECOVERY.

BY J. EUSTACE WEBB, M.B. ABERD.

A WOMAN aged twenty-seven years came under the care of my partner, Mr. Wm. Hammond, and myself on Aug. 1st, 1894. She had given up all hope of recovery, as she had been told by two medical men that she could not live many weeks. Her mother died of lung disease at the age of thirty-two, and on the maternal side there was a decided history of phthisis. Her father was aged fifty-eight; he suffered from rheumatic gout. She had no brothers or sisters. She had inflammation of the lungs in early childhood, since which time she had been perfectly well. In the latter part of June, 1894, she was suddenly attacked, at the time of her menstrual period, with pain in the right side of the chest, which was followed by cough and expectoration. When examined on Aug. 1st the right chest gave the following physical signs: Great dullness, extending all over the base of the lung posteriorly to a line well above the angle of the scapula, and at the side and anterior part of the chest below a line continued horizontally round from the ensiform cartilage; vocal resonance and fremitus were present, but not markedly increased; the breath sounds were distant, but heard to the extreme base. The tape at the level of the ensiform cartilage showed an increase of one inch on the right side. The breath was fetid, had the characteristic odour of pus, and the air of the whole cottage was pervaded with the same sickly odour. The expectoration was purulent and nummular. The body was fairly well nourished, but she stated that she was losing flesh rapidly. Her pulse was 120, her temperature 102° F., and her respiration 30. Her appetite was very bad, and the tongue was red and glazed. As she lived six miles from my house a record of her temperature &c. could only be taken once daily. On Aug. 9th the chest was aspirated in the axillary line in the sixth intercostal space; the needle penetrated to a depth of two and a half inches, and twelve ounces of pus, slightly mixed with froth, were drawn off. For some days after the operation she appeared greatly relieved, the fever of the breath was very much diminished, and she was able to relish her food. No marked improvement, however, was noted in

her pulse, temperature, or respiration; the breath sounds could be heard more distinctly at the base, but there was no appreciable diminution in the dullness. On Aug. 25th she vomited about half a pint of pus, and again the fever of the breath became less. The physical signs suggesting an increased collection of pus then became more marked, the dullness extending to above the middle of the scapula, behind and to a corresponding level in the side and anterior part of the chest. She was losing flesh rapidly. Her respiration was 40, the pulse was 120 and very soft, and she was passing loose evacuations many times in the day. On Sept. 2nd a large trocar and canula, the size of a No. 14 English catheter, was passed through the chest-wall into the lung just above the angle of the scapula, and between it and the vertebral column it was directed forwards and outwards. This spot was chosen because it seemed to be that of the maximum density. When the trocar was withdrawn a flow of pus through the canula continued until fourteen ounces were collected. A drainage-tube six inches long was then passed through the canula into the abscess cavity, the canula was withdrawn, the drainage-tube was secured to the skin with thread and sticking plaster, and covered with a thick absorbent dressing. Each day the dressings were changed, and at first they were always found saturated with discharge. During the dressings the patient was brought to the edge of the bed in the dorsal recumbent position and directed to cough; by this means many ounces of pus were discharged. After the fourth day the drainage-tube was replaced by one considerably larger in calibre; this was removed daily, and after cleansing was filled with powdered iodoform, reintroduced, and blown clear into the abscess cavity. On Sept. 17th an ethereal solution of iodoform was injected through the tube into the cavity, a proceeding which almost caused death, for the glottis was thrown into spasm, and the odour of ether was very strongly perceptible in the breath. From this date she improved in a marked manner and on Sept. 24th the discharge had practically ceased. From Sept. 2nd she took one grain of iodoform in pill every four hours, and continued to do so until her removal to the convalescent home. On Sept. 24th the measurement of the chest showed a decrease of two inches on the right side at the level of the ensiform cartilage. On Oct. 6th she complained of pain in the front of the chest, and a tender spot was exhibited in the fifth interspace immediately below the nipple. On the 9th, as there was evidence of fluctuation at this point, an incision was made through which dressing forceps were passed and opened, when a large quantity of pus came away. A drainage-tube was then introduced, filled with iodoform, as before described. In a few days the sinus closed. On Dec. 1st there was a difference of three and a half inches in the measurements of the two sides. The temperature was then 99°, the pulse 100, and the respiration 40 a minute. She was removed to St. Michael's Home near Brent on Dec. 6th, 1894, and there made an uninterrupted recovery. On March 8th the right side of the chest measured three inches and three quarters less than the left at the level of the ensiform cartilage. The whole of the lower lobe of the right lung appeared to be solid, the percussion note was absolutely dull, and no breath sounds could be detected. On March 19, 1895, she returned to her old situation, having gained over two stone in weight since Dec. 1st. She said she felt perfectly well.

Clinical Notes: MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

AN OPERATION FOR WEBBED FINGERS.

BY LEONARD A. BIDWELL, F.R.C.S. ENG.,

SENIOR ASSISTANT SURGEON TO THE WEST LONDON HOSPITAL, &C.

THE deformity of webbed fingers, although not a very serious one, is often very difficult to treat. In my opinion, all the older methods of treatment are unsatisfactory in their results. The main objects to be aimed at in an operation for such a deformity are the avoidance of cicatricial contraction and the least possible interference with the palmar surfaces of the fingers. Simple division of the web produces so much

subsequent cicatricial contraction that the fingers become more useless than before the operation. The only old operation which aimed at avoiding cicatricial contraction was that devised by Didot, in which flaps are cut from the dorsal surface of one finger and from the palmar surface of the other. In a tight web the flaps will not be sufficient to completely cover in the divided fingers, and the interference with the palmar surface of the fingers is undesirable. I have therefore devised the following operation. In the case of a web between the index and middle fingers an incision is made down the palmar surface of the web immediately between the two fingers; a triangular flap is then cut on the dorsal surface of the web, the apex of which reaches about midway between the knuckle and the first inter-phalangeal joint. This is dissected up; a third incision is made along the inner margin of the dorsal surface of the middle finger and continued down to the knuckle, as shown in the diagram. This flap is dissected up as far as the web, the fibrous tissue of which is divided, and then united to the inner margin of the palmar surface of the index finger. The triangular flap is also united at its apex to the angle between the palmar surfaces of the two fingers. The index finger is then completely and loosely covered with skin, while the middle finger is uncovered on its outer and on the greater part of its dorsal surfaces; these raw surfaces are then completely covered with Thiersch's grafts cut from the forearm. An

antiseptic dressing is applied and the hand kept on a splint for fourteen days; the wound is dressed at the end of a week and the stitches are removed, the whole surface being then healed. I have recently operated on a child aged two and a half years by this method. There was an extremely tight web between the middle and ring fingers, together with a loose one between the ring and little fingers (the latter extended only as far as the first interphalangeal joint). The web between the middle and ring fingers was treated in the way just described; the web between the ring and little fingers was simply divided after the formation of a triangular dorsal flap; the dorsal and plantar edges of each side of the web were then united with horsehair sutures. All the grafts took, so there was no cicatricial contraction; the movements of the fingers are perfect, and the result is in every way satisfactory.

In all plastic operations I think that it is most essential to leave no raw surface to heal by granulation, since, if this is done, cicatricial contraction is very likely to ensue, and will mar the result of such an operation. As I have pointed out before,¹ the new skin formed from Thiersch's grafts contains a cutis and papillae, and does not show any tendency to contract; in children, at least, it quickly becomes indistinguishable from the other skin. Another point in my operation which I consider of importance is that the

palmar surface of the fingers is not interfered with at all, and instead of making two indifferent fingers, as in Didot's operation, we can be certain of having at least one perfect one even in the untoward event of grafts falling. The triangular flap, which is dissected up from the dorsal surface and fixed into the angle between the fingers in front, makes it impossible for the web to reappear, and the resulting cleft is quite natural in appearance. In many of the textbooks it is recommended that no operation should be performed at an early age, but I consider that my operation should be performed at about the age of two. I feel inclined to recommend this early age since I have found that the skin formed from Thiersch's grafts is more perfect in early childhood than at any other age.

Wimpole-street, W.

A CASE OF POISONING BY STRAMONIUM SEEDS.

By RICHARD CATON, M.D. EDIN., F.R.C.P. LOND.,

PHYSICIAN TO THE LIVERPOOL ROYAL INFIRMARY.

THE following case was under the care of Dr. T. R. Bradshaw, assistant physician to the Liverpool Royal Infirmary, and the notes were taken by Dr. S. Ross, house physician to the infirmary.

The patient, a man of weak intellect aged twenty-nine, was brought to the out-patient department of the Liverpool Royal Infirmary at 11.45 P.M. on March 24th, 1895. He was comatose, with stertorous breathing. The pupils were very dilated and fixed. A bottle was produced containing stramonium seeds and whisky (the seeds were reniform, the surface being pitted and the taste bitter), which mixture he had been drinking. He had convulsive twitching of the arms and legs and lateral oscillations of both eyeballs. His skin was very dry. The pulse was 130, very frequent and small; the respiration was 30. A stomach-tube was passed, and a small quantity of the contents was obtained, including fifteen stramonium seeds. One-tenth of a grain of apomorphine was given hypodermically, and fifteen minutes afterwards he was removed to Ward 11 and placed in bed, hot bottles being placed around him. One-tenth of a grain of pilocarpine was injected subcutaneously, and one minim of croton oil was given. After waiting an hour for the apomorphine to take effect a hypodermic injection of one-sixtieth of a grain of strychnine was given. All this time he was delirious and having ice applied to his head. In half an hour he vomited freely, and henceforward began to improve. On the morning of the 26th he was quite rational. He suffered from retention of urine, and this was relieved by a soft rubber catheter. The urine was of sp. gr. 1020 and contained no albumen, but phosphates were present. The pupils were still widely dilated; there was a small amount of reaction to accommodation. The knee-jerks had been absent from the very first. Cutaneous sensibility was normal. On the 27th the pupils were contracting and reacted to light and accommodation; the knee-jerks were present.

Liverpool.

A BRIEF ACCOUNT OF THREE CASES OF PLACENTA PRÆVIA.

By W. F. GRANT, M.D. EDIN.

I HAVE within the last four months had three cases of placenta prævia, and, as the frequency of occurrence of such cases is estimated at one in 573 labours, I have thought that a note of them might be of some interest. My first case came under treatment on Feb. 18th last. It was the third pregnancy, the others having been normal. Hæmorrhage first began at the end of the fourth month, and there were slight losses at long intervals. At seven months and a half very serious hæmorrhage set in, necessitating interference. The child was stillborn. The mother recovered. The second case occurred on April 30th. Hæmorrhage first started at four months and a half, and there were four or five "shows" during the month following. There was then no recurrence of the hæmorrhage till the seventh month, when so severe a flooding set in, with threatened collapse of the mother, that the case had to be terminated without delay. The child made some very slight attempts at respiration. The mother made a good recovery. It was her eighth confinement, the other labours having

¹ THE LANCET, July 21st, 1894.

been normal. I was called to my third case on June 14th. Hæmorrhage had set in at six months. It had been going on slightly for a week, when some severe gushes rendered interference necessary, although the child had not reached a viable age. The mother made a good recovery. It is a fact of some interest that I had ten months previously confined the same woman with a placenta prævia, and at the same period of her pregnancy. She had had eleven previous confinements, several of them being premature births. In all my cases the head presented. Under chloroform the os was gradually dilated by the fingers, the placenta detached, the hand inserted between the placenta and uterine wall, and a foot brought down. In my last case a small piece of the placenta was found to be detached from the main body, and this piece had been engrafted over the os.

ROYAL FREE HOSPITAL.

A CASE OF DISEASE OF THE MIDDLE EAR IN WHICH A RESULTING TEMPORO-SPHENOIDAL ABSCESS DISCHARGED THROUGH THE NOSE; NECROPSY.

(Under the care of Mr. BOYCE BARROW.)

THE mode of termination of a cerebral abscess in the manner described in this case is of sufficient rarity to render the account of considerable interest. Writing on the subject of cerebral abscess due to otitis media, Dr. Bristowe¹ says: "An occasional result of abscess is its extension by bursting or by gradual erosion into the cavity of the arachnoid or into one of the ventricles, or its discharge externally through the ear or nose." The presence of the temporo-sphenoidal abscess was diagnosed in this case, and an operation for the evacuation of the pus commenced, when the unexpected and somewhat copious discharge from the mouth made it probable that some of the symptoms might be due to another and less serious condition. For the notes of this case we are indebted to Mr. Willmott H. Evans, registrar.

A woman aged thirty-eight years was admitted into the Royal Free Hospital under the care of Mr. Barrow on Feb. 1st, 1895. In 1882 she fell, striking her head. This accident was soon followed by a discharge from her right ear, accompanied by a good deal of pain and by complete deafness on that side. In April, 1890, she became an in-patient at the Royal Free Hospital, complaining of an intensely fetid discharge from the right ear. Her temperature was very irregular, and she had occasional rigors; there was also some weakness of the muscles on the right side of the face. The mastoid was explored and no pus was found at the first operation, but about a fortnight later at a second operation, a small quantity of pus was evacuated. Her condition improved, and she was discharged five weeks after admission; but three weeks later she was readmitted, suffering from severe headache. The discharge from the ear was still somewhat offensive. The mastoid cells were carefully cleared out, the dura mater was exposed, and an irregular pus-containing cavity was opened, lying between the dura mater and the bone. This was cleansed as completely as possible. After this operation her condition greatly improved, and she left the hospital a fortnight later with a slight discharge from the ear, but otherwise well. From that time she had been in fairly good health, but had suffered occasionally from pain in the right ear, but no discharge. Last Christmas she caught a severe cold, she became completely deaf on the right side, and there was sharp pain in the right ear. About a week before readmission she noticed a swelling behind the same ear, which after being poulticed for two days broke and discharged a great deal of thick fetid pus through the old scar. On Feb. 1st she

came back to the hospital and was readmitted. The patient had had scarlet fever when a child, but it was not followed by any discharge from the ear. There was nothing noteworthy in her family history. On admission her general condition was good. She complained of great pain in the head, and of tenderness over the right mastoid and down the course of the internal jugular vein. Behind the ear there was a scar which had in part given way, and from the opening so formed pus was oozing. Behind the angle of the jaw on the right side there was a rounded swelling about an inch and a half in diameter; it was tender and hard. On examining her eyes no optic neuritis was to be seen. Her temperature varied somewhat, but was fairly constant at about 102° F. Soon after admission she became very drowsy, and as her temperature still continued raised it was decided to operate, so on Feb. 3rd the scar, from which pus was coming, was opened up, and some extremely fetid granulation tissue was scraped away from the opening into the mastoid. The bone surrounding the opening was found to be intensely hard. The wound and the external auditory meatus, from which also fetid granulation tissue had been scraped, were syringed out with a lotion of carbolic acid (1 in 20) and dressed with glycerine and iodoform gauze. During the operation slight twitchings of the muscles of the right side of the face were noticed. On Feb. 4th, after the operation, the temperature fell to normal, but soon rose again to 101.2°. The facial palsy was still evident, the right eye not being closed so completely as the left. The swelling in the neck had extended further down, and was redder. The temperature continued to be very irregular and on the 6th reached 104°. The drowsiness was more marked, and the patient complained that she could not swallow; for this no cause could be discovered in the throat. Incontinence of urine and fæces was present. On the 7th the dysphagia was so great that nutrient enemata were employed. Early on the morning of the 8th the patient had an attack of dyspnoea, becoming very blue; finally she coughed up about two ounces of very fetid pus, and then she seemed much better. The drowsiness became more marked, and at midday on the 8th Mr. Barrow decided to operate. The patient was anaesthetised with the A.C.E. mixture, and Mr. Barrow with chisel and mallet cut away the skull wall behind and above the mastoid process, laying bare the lateral sinus. The bony walls of the mastoid cells were found to be necrosed and filled with caseous pus, which was scraped away. At this moment some pus was seen to be running from the mouth, which seemed to be almost filled with it. The wound was syringed out with carbolic acid lotion and dressed with glycerine and iodoform gauze. Soon after the operation the temperature fell somewhat, but rapidly regained a point over 103°; it varied greatly, sometimes even reaching normal. Pus continued to flow from the mouth, but the amount could not be estimated. The facial paralysis became more marked after the operation. On Feb. 9th the patient's condition had much improved. She was quite sensible and complained of no pain, and her temperature had reached normal. On Feb. 11th her condition was possibly a little better. The pus continued to be discharged from the mouth, but its source could not be discovered. The urine contained much albumen. Attacks of cyanosis came on at irregular intervals. On Feb. 12th the pus had ceased to flow from the mouth, and several attacks of cyanosis had occurred. The respiration was very rapid and shallow. The facial palsy was well marked. The drowsiness was increasing. At 12 noon a severe attack of cyanosis occurred, and in spite of the administration of restoratives the patient gradually sank, dying at 3 P.M.

Necropsy.—At the necropsy, on Feb. 13th, the body was found to be well nourished; rigor mortis was little marked. On removing the dura mater from the right side of the brain pus was seen on the upper surface of the right frontal lobe, and a collection of pus (about one ounce) was found on the under surface of the right frontal lobe, which had been greatly compressed by it. The pus extended to the cribriform plate of the ethmoid, which was apparently abnormally perforated at the side of the crista galli. A track of pus led back from the large collection along the under surface of the brain to the outer surface of the right temporal lobe, where a small aperture communicated with an abscess cavity, containing about a drachm of pus, in the temporal lobe. A small scale of separated bone was found on the petrous portion of the temporal; it had no pus round it, and was probably the result of the operation. The superior longitudinal sinus was thrombosed, but not the lateral sinus.

NORWOOD COTTAGE HOSPITAL.

ABDOMINAL SECTION; ENUCLEATION OF PELVIC UTERINE
FIBROID; SUTURING POSTERIOR UTERINE WALL;
RECOVERY; REMARKS.

(Under the care of Dr. J. H. GALTON.)

THE operations for uterine myoma are briefly described as follows: (1) simple myomectomy or removal of the tumour without any of the uterine tissue, by excision or by enucleation and without entering the uterine cavity; (2) hysterectomy, total or partial, or removal with the tumour of more or less, or all, of the uterine tissue proper, usually with entrance of the cavity. The exact operative measures which may be required in the case of an abdominal tumour cannot be always given before the abdominal cavity has been opened, and this statement applies even more strongly to uterine fibromyoma. The surgeon will obtain the best results who is best prepared to adapt himself to the circumstances of the individual case.

A woman aged forty-two years was admitted to hospital on Nov. 4th, 1894. Her paternal aunt died of cancer of the breast. Menstruation had always been regular, painless, and moderate in quantity. Ten months ago the patient first felt a heavy feeling at the lower part of the abdomen; she had twice been unable to pass urine, and the bowels were confined. Dr. Galton then saw her, and examined externally the lower part of the abdomen, finding only slight fullness of the right iliac region, for which an aperient was prescribed. Two months ago she first felt a lump in the lower part of the right side of the abdomen. She had had no pain. On Oct. 15th Dr. Galton saw her again and found a tumour above and to the right side of the pelvis, occupying the right iliac and hypogastric regions, and dull on percussion. On vaginal examination the os was found high up, tilted above the pubic arch, and behind it a well-defined tumour occupying the position of Douglas's pouch and almost filling the pelvis. It was rounded and hard to feel per rectum, and could not be lifted out of the pelvis. Dr. Horrocks saw the case and recommended abdominal section with removal of the tumour if possible. The operation was performed on Nov. 5th, at 11.30 A.M. Chloroform was administered by Junker's inhaler, and Mr. Sidney Turner, Dr. Shearer, and Mr. Arthur Turner assisted. A three-inch incision was made in the middle line of the abdomen below the umbilicus. The uterus and ovaries were found in front of the tumour; the uterus was movable upon it, but connected with it by a band of uterine tissue. It was impossible to raise the tumour or to encircle it owing to the broad base of reflexion of the peritoneum above it. A double ligature was passed through the broad ligament on either side and tied on each side of the ovary and the ovaries removed. As the tumour gave a sensation of fluctuation a small Simpson's trocar was passed into it, and the wound bled so freely as to leave no option but to proceed with the removal. The abdominal incision was extended one inch downwards. The opening of the trocar was enlarged by incision through the peritoneum and the tumour gradually enucleated by the fingers, leaving it attached by a muscular band to the back of the uterus. This was tied in two places and divided between, but the uterine ligature was divided in separating the tumour and disclosed a wound of the posterior wall, through which a uterine sound passed into the peritoneum. This wound was united with four silk sutures. The broad ligament pedicles were dropped in (no washing out of the pelvis or drainage was employed) and the abdominal incision closed by five deep silver wire sutures and four superficial ones. Boracic acid was sprinkled over the wound and green protective placed over the suture ends; then gauze pads and a flannel bandage were applied. The tumour weighed 1 lb. 10 oz. The operation lasted one hour and twenty minutes. The patient was a good deal collapsed during it. After putting her to bed the pulse was 58, feeble, and the temperature 97.8° F. At 6 P.M. the temperature was 100°, the pulse 80, and the respiration 24. At 8 P.M. half an ounce of urine was drawn by catheter. There was a slight vaginal discharge. On Nov. 6th the pulse was 84, the temperature 99.5°, and the respiration 24. At 2 A.M. nine ounces of urine were drawn off, and at 8 A.M. eight ounces. Milk and barley water, one ounce of each, were given every hour. At 7 P.M. the patient passed naturally eight ounces of urine. The vaginal discharge had ceased. On Nov. 7th the pulse was 80, the

temperature 100.2°, and the respiration 20. She passed flatus. On Nov. 8th the patient had beef-tea and meat juice, alternated with the milk and barley water. The pulse and temperature remained about the same, the latter ranging up to 100°. The patient was excitable and easily disturbed by sounds. On Nov. 9th she had chicken with half a wine-glassful of Burgundy. Six ounces of warm water as enema had no effect. On Nov. 10th two cascara sagrada tablets, followed by soap-and-water enema, in fourteen hours caused free action. On Nov. 12th the wound was dressed, all the sutures were removed, and it was healed throughout. On Nov. 18th and 19th the temperature rose to 101°; on the latter day to 102°, and there was a slight discharge from the lower part of the wound. This was entirely superficial, and ceased after a few days' use of the drainage-tube. On Nov. 20th and 21st the temperature was still 101.8°. On Nov. 22nd she had a copious watery motion, mixed with blood and mucus, and very offensive, after which the temperature sank to normal, and the patient gradually improved till Dec. 8th, when she returned home.

Remarks by Dr. GALTON.—I saw her after her return and found the pelvis free from swelling internally, and during my absence owing to severe illness she was seen by Mr. Sidney Turner, who reported that the pelvis was free and the uterus slightly movable.

GRIMSBY HOSPITAL.

CASE OF PERFORATING WOUND OF THE RIGHT PLEURA;
RECOVERY; REMARKS.

(Under the care of Dr. S. HERBERT HOUSE, house surgeon.)

By the modern methods of treatment of wounds of the chest involving penetration of the pleura it is well known that most excellent results are obtained. Even in the case of gunshot injuries, Dr. Charles Adams considers that we have now forty-five fewer deaths in every hundred than obtained formerly. There is a general opinion at the present day that, with careful cleansing, all penetrating wounds of the chest may be entirely closed after any accumulation of blood has been allowed to come away. The rapid recovery from the effects of the injury in this case, as evidenced by the patient's condition on the third day, is remarkable.

On April 25th, 1895, a boy aged four years was brought to the Grimsby Hospital with a history of having fallen down a flight of stairs on to some broken crockery, cutting his back. The accident had happened at 7.30 P.M.; he was brought to the hospital after 10 P.M. When seen he was collapsed, breathing rapidly in a jerky way. The pulse was very feeble, 152. Across the back there was a large lacerated wound seven inches long, extending through the muscles to the spine at the level of the ninth dorsal vertebra, and on the right side reaching to the seventh intercostal space, in which there was a wound through the pleura parallel to the ribs an inch and a half long, through which air was whistling in and out of the pleural cavity; the lung was entirely collapsed. The only covering was a dirty blanket. As quickly as possible all parts of the wound were thoroughly cleansed with 1 in 40 carbolic lotion, care being taken to prevent any entering the pleural cavity. There being very little hæmorrhage the wound was sewed up at once with silk-worm gut sutures, drawing the skin over the wound in the pleura, and finishing with a firm dressing of cyanide gauze and alembroth wool. During that night the child was restless, but had some snatches of sleep. Respiration varied from 40 to 50. The temperature was 99° F. and the pulse 130 to 150 and over. The next day the child was less restless; he was propped up in bed and in the afternoon he joined in some singing which he could hear from another ward. The pulse was 130 and the respiration 38. That night the temperature was 100°, the only time in the progress of the case it was above the normal; the patient slept quietly all night. The child made an uninterrupted recovery. Respiration on the third day was 30 and the pulse 120. He ate and slept well. The wound healed by first intention, and the stitches were removed on May 1st, when the breath sounds could be heard at the base (right). On May 20th breath sounds could be heard all over the right side. The child was up and running about.

Remarks by Dr. HOUSE.—The points of interest, I think, are that for nearly three hours air passing through a dirty blanket, which was all that covered the wound, was entering the pleural cavity, and the singularly rapid recovery, as on the afternoon of the third day he was singing vigorously as though nothing was the matter with him.

Medical Societies.

OPHTHALMOLOGICAL SOCIETY.

Ophthalmia Nodosa.—Nine cases of Chancre of the Con-junctiva.—Exhibition of Specimens.

AN ordinary meeting of this society was held on June 13th, Dr. ARGYLL-ROBERTSON, President, being in the chair.

Mr. J. B. LAWFORD described cases of *Ophthalmia Nodosa*, which he described as an affection produced by the penetration into the eye of the hairs of certain varieties of caterpillars; and he related the case of a lad aged sixteen who in September, 1894, came to him with a history of having been struck in the right eye by a caterpillar which had been thrown at him. The skin of the hand with which the lad had touched the caterpillar became irritable and sore, and a number of small white spots developed. The eye became inflamed in the course of a day or two, and when he presented himself there was marked oedema of the lids, with photophobia and lacrymation. The pupil was contracted, the lids could not be everted, and no foreign body could be detected. There was no pain except on exposure to light. He was ordered instillations of cocaine and atropine, and two days later there was less photophobia and the pupil was well dilated and quite round. The upper eyelid was everted, but nothing abnormal could be seen. The lower palpebral conjunctiva was much congested and a few pale papular elevations were visible on its surface. The cornea was clear and there were no synechiae. A few days later two or three black spots corresponding to the centres of the elevations just referred to were made out with the aid of a lens. On Oct. 4th the eye was rather better, but the lower palpebral conjunctiva was still much thickened, and a number of soft smooth elevations were seen in addition to the white papules. Two small hairs were removed from the lower eyelid, the ends of which constituted the black points alluded to above. No others could be seen. The eye slowly improved, and on Oct. 12th the patient was sent home. Two months later he returned, and the eye was still improving. He was not seen again till Jan. 25th of this year. There had been recurrence of all the symptoms a few days after the last visit. The iris was discoloured, but there were no nodules, and the cornea was clear as far as could be seen. Mr. Nettleship saw the boy in consultation, but it was impossible to make an ophthalmoscopic examination of the fundus. He remained in hospital till March 15th. For four weeks there was very little change in the condition of the eye, which improved for a while and then relapsed. Tension was variable, but about normal. Mr. Lawford mentioned twelve cases which had been reported under different names. In all the diagnosis was ultimately established by the discovery of hairs and their identification as the hairs of caterpillars. In all the cases the inflammation was more or less patchy and the signs were those of iritis or irido-cyclitis, occasionally with diminished tension. In one, a doubtful case, there was detachment of the retina. The nodules were said not to develop for two or three weeks after the injury, but the period was very variable. The malady was specially characterised by repeated exacerbations and remissions. The pupil might become blocked wholly or partially by exudation, as in iritis from any cause. The nodules which constituted the characteristic feature of this affection, had been removed and examined, and they closely resembled tubercles—in fact, only microscopical examination and the discovery of the hair enabled the distinction to be made. One notable fact was the large quantity of atropine required to maintain the dilatation of the pupil. The prognosis must be guarded, dependent as it was on the date at which the patient was first seen and on the intensity of the symptoms. In conclusion, Mr. Lawford pointed out that the affection might very easily be mistaken for tuberculous iritis. All the patients came from the country, and the disease only occurred during the months in which caterpillars were active. In this country there was ground for believing that the insect was *bombyx rubi*, which did not appear till the month of August. The irritation might be caused by some poison on or in the hairs.—Mr. HARTIDGE thought that if the symptoms were due to the effects of a poison conveyed by the hairs one would expect them to pass off after a time, and this would not account for the exacerbations; there, he thought, would be more easily explained by assuming that

the hairs themselves travelled about from time to time.—Mr. DONALD GUNN said it was commonly believed that severe ophthalmia occurred among soldiers in India in consequence of a certain kind of caterpillar crawling over their eyes while asleep. It was, however, not one of the hairy kind, but had a smooth, green body. He was not prepared to say whether this was anything more than a story.—Mr. LAWFORD, in reply, said the migration of the hairs only appeared to take place for a short time after their entrance into the eye. They then became embedded in collections of cells, the accumulations giving rise to the characteristic nodules. They remained there till they underwent disintegration. There was the fact also that even when there was no evidence of the hairs having reached the iris, this and the ciliary body were both affected. The disease alluded to by Mr. Gunn, if it actually existed, must be essentially different to that under discussion.

Mr. SIMMONS SNELL stated that he had collected notes of nine cases of Chancre of the Conjunctiva, and he related some of the more typical seeing that very few had been reported, though they could be by no means uncommon. The first case was that of a woman aged twenty-one with a chancre at the internal canthus involving both eyelids, but the lower in greater degree. The caruncle was also implicated. The ulcer was the size of a shilling and there was much induration. The gland in front of the ear and the submaxillary gland were enlarged. She was a nurse and had probably contracted the disease from an infant, the offspring of syphilitic parents. She was engaged to be married at the time, but the marriage was postponed until nine months later. She had since been pregnant six times, but had never gone to full time. The sixth child, the only one living, was now three and a half years of age. It appeared to be healthy until ten months of age, when it developed signs of congenital syphilis and had since had its followed by paralysis. The patient herself was well and looked healthy, but there was epiphora as a result of the local lesion. There was no history of the husband having suffered from the disease. The second case was that of a man aged thirty who was first seen on Sept. 20th, 1887. He was married and was the father of five healthy children. He said he had cut his head open and had washed the wound with some blood-stained fluid, the accident having occurred in a slaughter-house. A month later a small spot appeared, and when he presented himself there was an ulcerated surface with indurated base and raised edges involving the entire outer surface of the right upper eyelid. The pre-auricular and cervical glands were enlarged. The patient suffered among other things from an eczematous condition of the penis and scrotum. His wife was seen in June, 1888 having had lumps in the groin with ulceration of the tongue &c. The third case was that of a man aged fifty-five with a chancre on the right inner canthus involving both eyelids at the junction. The pre-auricular gland was indurated. The ulceration healed in six weeks. Nothing was made out with respect to the mode of infection, but he lived in a model dwelling-house in which there were only four towels for eighty persons. The other cases resembled those related; the ages ranged from childhood to adult life, and the cases comprised four males and five females.—Mr. MARSHALL recalled one case in a man aged twenty who presented a small ulcer at the margin of the cornea; the adjoining glands speedily enlarged, and the usual manifestations followed.—Mr. HILL GRIFFITH said the interest of these cases lay entirely in the diagnosis. He saw two or three every year, but he never made the diagnosis unless there was an eruption. The ulcers resembled those due to tubercle, but the induration of the glands was never absent in syphilis. He pointed out that a vaccine pustule presented very marked resemblance to a chancre, and he had collected half a dozen cases which were not yet published. In these there were more infiltration and discharge and the process of development was much more acute.—Dr. BRONNER (Leeds) said such cases were not very rare, but the subjective symptoms might be very slight and patients might recover from the disease without ever coming to a hospital.—Mr. SNELL, in reply, contended that with an indurated sore and enlarged glands there was no need to await an eruption before commencing treatment. If the induration cleared up under mercurial treatment that settled the matter.

The following card specimens were shown:—

Mr. H. SECKER WALKER: (1) Sarcoma of the Iris; (2) Epithelioma of the Cornea and Conjunctiva; (3) Coloboma of the Iris and Choroid.

Mr. DEVEREUX MARSHALL: Cystic Sarcoma of the Ciliary Body.

Mr. MORTON: Microscopical Sections of Tumour of the Face.

Mr. J. B. LAWFORD: Peculiar Coloured Deposits in Crystal-line Lenses.

Mr. H. WORK DODD: Congenital Pigmentation of Retina.

Mr. SILCOCK: (1) Congenital Anterior Synechia; (2) Tuberculosis of Eyeball Recovering.

Mr. NETTLESHIP: Case of Retinitis Proliferans.

Mr. DOYNE: (1) Case of Acromegaly; (2) Degeneration of Retinal Arteries.

Dr. BEVOR: Case of Ophthalmoplegia Externa.

Reviews and Notices of Books.

Das Fieber. Von Dr. G. B. UGHETTI. Aus dem Italienischen übersetzt von Dr. R. TEUSCHER. Jena: Verlag von Gustav Fischer. 1895. (*On Fever.* By Dr. G. B. UGHETTI. Translated from the Italian by Dr. TEUSCHER. Jena: G. Fischer. 1895.)

"FEBRIS est quid neque tu scis, neque ego, neque quisquam medicorum." This quotation from the writings of Stoerk a century ago is given by the author at the close of his introductory chapter to a monograph which, for freshness of style and acuteness of criticism, has well merited the honour of being translated into German. The phrase might have stood as the motto of the work, the whole tendency of which is to demonstrate that, in spite of increasing pathological knowledge and abundant inquiry into this special subject, there is really still profound ignorance upon the essential nature of the febrile process. Dr. Ughetti, who is Professor of General Pathology at the University of Catania, in arriving at a conclusion so humiliating to our scientific pride, has not done so without having fully studied the subject, and his book is one which deserves the most attentive consideration. The subject in itself is one of the most fascinating in pathology, but it must be obvious that we can hardly expect to arrive at the truth of the febrile state until we have cleared up all the problems of animal heat. Crudely stated, the modern conception of the regulation of the heat of the body and its maintenance at a fixed level, which varies with the species of animal concerned, is supposed to be due to the thermotaxis of the nervous system, which controls and balances thermolysis and thermogenesis. This theory, for it is nothing more, also affords scope for the explanation of the febrile process, by referring it in the main to derangement of one or other factor, especially that of thermogenesis. Yet that does not answer the question as to what fever really is, and when we study the antecedents of fever we seem no nearer to a solution. Thus we seem to see in the fever that ensues on inflammation the effect of the absorption of toxins acting injuriously on the thermogenic centres, and similarly with the fever following on specific infection. Yet it may equally be held that the febrile, like the inflammatory, process is nature's effort to antagonise the noxious influence. But it is said that fever may be excited by traumatism apart from any septic or toxic agency, and again that there is no necessary relation between the latter and the amount of fever exhibited. These and cognate problems are discussed with marked ability in chapters on the Causes of Fever and the Theories of Fever. Thermometry, the symptoms of the febrile state, the types of fever, diagnosis and prognosis, and the anatomical changes ascribed to it are treated in turn with lucidity and knowledge. The whole leads up to the moot question of treatment. As stated, it would seem that the antipyretic phase on which therapeutics has entered within the past twenty years, owing much to the powerful advocacy of Liebermeister, is not an unmixed gain, for it all turns on the point whether fever *per se* is of advantage to the organism or

not. With not unnatural sarcasm the author shows how venesection, once the routine, gave place to a treatment consisting of covering the body with warm clothing and the administration of hot fluids, which by a violent reaction was replaced by a resort to cold, and this again by the introduction of drugs more or less active in reducing abnormal temperature. He thinks that we have now reached a period of transition, one of indecision, wavering between faith and scepticism, sometimes thinking that the best we can do is to leave the fever alone. Whilst so far agreeing with him that indiscriminate antipyresis, especially in the use of antipyretic drugs, is to be deprecated, and also that too much stress has been laid upon rise of temperature as in all cases justifying a resort to these measures, we are quite unable to agree with him in the inevitable adoption of an expectant attitude. He is right of course in saying that when the cause is ascertainable its removal is the only rational line to pursue; but it is impossible to have lived through the experiences of the past twenty years without confessing that, blind as it may be, erroneous as it probably sometimes is, the introduction of antipyresis in its widest sense has effected a marked result on the mortality from fever. Dr. Ughetti says that the action of cold physiologically is to increase the tissue changes that are increased by fever already; but, even admitting this, it must be confessed that the general result is to place the patient in a better condition than he would be were the fever uncontrolled. Moreover, he seems to us to have minimised the results of this treatment, which have been accruing from all quarters since its introduction. Nevertheless his monograph is not to be neglected; it is manifestly the product of a thoughtful mind, and its perusal should not be abandoned because its criticism is keen and its conclusions are novel.

Rapport et Mémoires sur l'Éducation des Enfants normaux et anormaux. Par E. SÉGUIN. Paris: Bureau du Progrès Médical. 1895.

THIS work forms the third volume of the *Bibliothèque d'Éducation Spéciale*, edited and prefaced by Dr. Bourneville, physician to the children's department of the Bicêtre. Although Séguin was a Frenchman by birth and education, and some of his earlier work was done in France, political troubles induced him to leave his native land for the United States shortly before the commencement of the second empire, and his life was from that time till his death mainly spent in America. The editor says of him in the preface: "Séguin français est un inconnu en France"—hence the translation into French of works written originally in English by a Frenchman. In the preface is given a review of his life and work. Concerning himself throughout his life with the education not only of idiots and feeble-minded children, but with the principles upon which the education of normal children should be conducted, he was sent as United States Commissioner to the Vienna Exhibition of 1877 to report on the Educational Section. The bulk of this work consists of a translation into French of this report, the second edition of which was revised by the author just before his death in 1880. In Part I. is considered the Education of the Child from the cradle upwards, and in Part II. Education of the Deaf and Dumb. Part III. contains a description of the Methods of Educating Idiots and Weak-minded Children in various countries, and Part IV. is a dissertation on Popular Education as it is and as it ought to be. The author's main contention was for the necessity of educating upon physiological principles; he was opposed to ecclesiastical interference, and was in favour of the co-education of the sexes and of increasing the number of female instructors. In addition to the above-mentioned report there are also included translations into French of two papers by Séguin

which appeared in the *Archives of Medicine* in 1879 and 1880 on the Psycho-physiological Education of an Idiot Hand and the Psycho-physiological Education of an Idiot Eye, both referring to the same patient. The first was translated into French in the *Revue de Médecine* in 1880, and the second is now translated by Dr. Bourneville. The present volume is of value not only to those engaged in the care and treatment of idiots, but also to those who are concerned with the education of normal children.

The Medical Annual and Practitioner's Index: a Work of Reference for Medical Practitioners. Bristol: John Wright and Co. London: Simpkin, Marshall, Hamilton, Kent, and Co., Limited. 1895.

YEARLY summaries such as this are naturally welcomed by the majority of the medical profession, and are to many of us practically indispensable. Even the most favourably circumstanced and industrious readers find it a hard task merely to peruse the mass of new observations and suggestions ever accumulating in periodical literature and standard works. To this congestion of information the skill of the practised abbreviator comes as a much needed relief, and the utility of the present work is evidenced by the appearance of the thirteenth annual volume. About two-thirds of the book is taken up with an account of the principal advances in medical and surgical practice recorded during 1894. Under the former of these two headings the treatment of diphtheria by antitoxin serum perhaps claims most attention, and is dealt with in a special article by Dr. Armand Ruffer, honorary secretary of the British Institute of Preventive Medicine. After some details as to the history of the discovery he describes the immunisation of the horses which yield the serum, and quotes statistics showing that the hospital mortality of diphtheria has been reduced by about one-half since the employment of the new remedy. There is also a copious list of pharmacopœial remedies against diphtheria, recommended by various authors. Dr. Colcott Fox reviews Dr. Byrom Bramwell's treatment of psoriasis by thyroid extract, and adds as the result of his own experience that the extract is useful in such cases, though probably not more efficacious than some of the older remedies. The most satisfactory application, apart from its staining effect, is chrysarobin, made up with zinc oxide, lanoline, and vaseline. The thyroid treatment of sporadic cretinism is the subject of an article by Dr. Shuttleworth, late medical superintendent of the Royal Albert Asylum for Idiots, Lancaster. His conclusions are very favourable to the treatment, and its results are depicted in engravings of patients before and after the use of the remedy. The important question of the dietetic treatment of phthisis is discussed by Dr. Loomis of New York in a comprehensive and minutely detailed article of several pages. Meat and milk are the alimentary substances on which he mainly relies. He has known phthisical persons to live for months on nothing else, gaining speedily in flesh and strength. The patient should take six meals a day, with meat in some form at each of them. During the first stage of the disease two pounds of beef at least should be consumed in the twenty-four hours, or its equivalent in the juice squeezed from a lightly-broiled thick steak. The author directs that in all cases the meat should be "rare," a word which in this connexion is the American equivalent for "underdone." Cod-liver oil or one of its preparations is to be taken freely, but cough mixtures are to be avoided as much as possible. Dr. Saundby of Birmingham writes on diet in diseases of the stomach. He recommends that in dilatation, so often associated with catarrh, at least five meals should be taken daily, each not exceeding five or six ounces, care being taken to avoid lumps of solid food. Milk and meat powder, made into gruel, are very useful in these cases. In hæmatemesis from gastric ulcer he gives nothing

but nutrient enemata, repeated every four hours, and consisting of an egg beaten up with sufficient milk to make four ounces, with the addition of a drachm of brandy if required. Habitual dyspeptics should use tea and alcohol in moderation only. In another part of the volume there is a notice of the treatment of gastric ulcer by small doses of potassium bichromate as advocated by Professor Frazer of Edinburgh. Among the references to lately recognised and infrequent morbid conditions may be mentioned the memoirs on various forms of Angio-neurosis by Dr. Ramsay Smith, and on Friedreich's disease (general ataxia associated with club-foot) by Dr. Hector Mackenzie of St. Thomas's Hospital. Each of these articles is illustrated by plates. Mr. Simeon Snell of Sheffield contributes a valuable essay on Eye-sight and School-life, accompanied by no fewer than eight plates. This subject, of such importance to the rising generation, deserves the attention of parents and teachers everywhere, and is very competently handled by the author. Briefly, his recommendations are—the avoidance of small print, fine sewing, and unsteady artificial illumination; the necessity of school-rooms which admit plenty of light either from above or on the left-hand side of the desks; the selection of seats provided with backs and of desks of a suitable height. Dr. Smyly, master of the Rotunda Hospital, Dublin, writing on the Prevention of Puerperal Fever, deprecates the usual vaginal examination during labour, and recommends instead of it the external palpation of the abdomen. Having for many years practised the vaginal method exclusively, he at first had a difficulty in believing that external examination could be easier and more reliable; but experience has satisfied him that it really is so, and he remarks that obstetric students trained according to this system make fewer mistakes than those who follow the ordinary procedure. Among the gynæcological operations Dr. Smyly describes vaginal hysterectomy according to the method of Doyen of Reims, and abdominal hysterectomy as practised by Martin of Berlin. He has performed each operation five times; the vaginal hysterectomies were all of them quite satisfactory, but one of the abdominal cases was unfortunately fatal. Abdominal surgery is dealt with under various headings by Mr. Mayo Robson. Under Spleen (surgery of) he makes reference to many cases of successful removal of this organ on account of rupture, "movable spleen," and simple hypertrophy, quoting from our columns¹ the observation that splenectomy in leukaemia has been almost invariably fatal. It is, however, in connexion with lesions of the gastro-intestinal tract that the recent advances of operative surgery have been most apparent. Of these procedures a tolerably full account is given by Mr. Robson, together with references to an ample bibliography. After mentioning his preference for the decalcified bone bobbin in operations for producing entero-anastomosis, he goes on to describe the operations for this purpose devised by Dr. Cozens Bailey and Dr. J. B. Murphy, the former of whom uses a decalcified bone tube, and the latter a two-part button. Several engravings make these explanations quite clear. Mr. Allingham's treatment of intestinal stricture by making a longitudinal incision and transforming it by stitches into an apparently transverse one is explained and illustrated by engravings. Several pages are devoted to operations on the stomach, such as gastrotomy, pyloroplasty, and gastro-enterostomy. The section on the surgery of the gall-bladder is longer, and contains two illustrations showing the method of making an anastomosis between the gall-bladder and intestine in cases of stricture of the bile-duct. Mr. Mayo Robson has performed this operation thrice, each time with success. In recurrent appendicitis the quiescent period is the most favourable time for surgical interference, an instance of

¹ THE LANCET, May 5th, 1894

which was afforded by the series of nine cases successfully operated on by him and published in our pages.² Mr. Arbuthnot Lane describes his method of treating oblique simple fractures of the tibia and fibula. He employs a sheet-iron splint provided with a foot-piece movable round the axis of the limb and capable of being fixed at an angle corresponding to the natural position of the foot. Recognising the difficulty according to ordinary methods of restoring the obliquely fractured tibia and fibula to their normal outline, he exposes the ends of the bones and brings them into accurate apposition by means of steel screws. Dr. Robert L. Watkins of New York contributes an illustrated description of the Granular Masses in the Blood, or so-called third blood corpuscles, considered to be pathognomonic of tuberculosis. He quotes cases occurring in his own practice which exemplified the value of this symptom as an aid to diagnosis. Sections devoted to New Remedies. Electro-therapeutics, Sanitation, Surgical Appliances, &c., make up the remainder of the volume, which is unquestionably a useful work of reference, well deserving its popularity.

A Medico-Topographical Account of Jeypore. By Brigade-Surgeon-Lieutenant-Colonel HENDLEY, C.I.E., Bengal Medical Department, Hon. Vice-President of the International Congress of Hygiene at Budapest, 1894, and Delegate for Rajputana at the Congress of 1891, &c. Calcutta: Printed by the Calcutta Central Press Company, Limited. 1895.

THIS volume is a record of what has been done in the past as regards health and allied subjects in the city and districts of Jeypore, and is based on the author's experience of twenty years as residency surgeon and thirteen as superintendent of dispensaries at Jeypore, Rajputana. It has been written in the hope that the information may prove useful—as it certainly will, we may add—to the author's successors in the post he now occupies, and in the belief that money will be saved to the State in the future by the prevention of an unnecessary repetition of experiments. The idea is an excellent one, and we concur in thinking that if a somewhat similar account were drawn up for every station in India—as has now been ordered by the German Government to be done for each military cantonment in the German empire—it would prove of real value. The work is full of pertinent facts and details and is copiously illustrated by maps, diagrams, and charts, the preparation and arrangement of which must have cost its author a large amount of time and labour. The topography, meteorology, water-supply, sanitary arrangements, vital statistics, and diseases of the city and districts of Jeypore and various other useful points are set forth and discussed with the local knowledge and experience which Brigade-Surgeon-Lieutenant-Colonel Hendley's long and valuable service in that part have given him. He has every claim to speak with authority on such matters. It should be added that the Jeypore Durbar, with its usual liberality, has borne the expense of publishing the work.

Transactions of the American Gynecological Society for the year 1894. Vol. XIX. Philadelphia: W. J. Dorman. 1894.

THE nineteenth volume of the Transactions of the American Gynecological Society, though somewhat smaller than its immediate predecessors, contains several papers of interest. The President, Dr. Lusk, in his address dealt with the Relative Value of the Various Surgical Methods of Treating Uterine Fibroids. He said there was nothing in gynecology which in an equal degree marked the boundary line between the old order of things and the new as the recent discussions upon the surgical treatment of uterine myomata. He considered that no achievement in surgery had ever borne witness

so completely to the triumph of human ingenuity over anatomical difficulties as the safe extirpation of the enlarged uterus, and he referred with pardonable pride to the leading part taken by the members of the society he was addressing in bringing his operation to its present position. At the same time, Dr. Lusk uttered a note of warning against the adoption of radical treatment in every case of uterine fibroids. The argument derived from the supposed liability of myomata to undergo malignant changes seemed to him clinically of little value. Among palliative measures he considered that curetting furnished the largest number of disappointing results. Removal of the uterine appendages for fibroids, which is scarcely to be classed either as a palliative or as a radical measure, had given him satisfaction in five cases that had been under his observation recently. He thought this operation unsuitable for large tumours or cystic tumours, and suggested also that it was probably of questionable value in cases where the fibroids, being situated low down, are nourished more especially by the uterine arteries.

Year-Book of the Scientific and Learned Societies of Great Britain and Ireland: comprising Lists of the Papers read during 1894. Compiled from Official Sources. Twelfth Annual Issue. London: Charles Griffin and Co., Limited. 1895.

ABOUT one-fifth of this useful and convenient work of reference is devoted to the medical societies of England, Scotland, and Ireland, the names of the presidents and secretaries and place of meeting being given in each instance, together with the titles of all the papers read during 1894, and their authors' names. A list of the publications of the Medical Department of the Local Government Board is also included in this section. Under the headings "General Science," "Chemistry and Photography," and "Biology, including Microscopy and Anthropology," there are also to be found the titles of many papers on medical subjects and on cognate branches of science. The compiler has succeeded admirably in presenting within moderate limits a summary of a year's work in all departments of knowledge, whether mental or mechanical, scientific or transcendental.

Analytical Records

FROM

THE LANCET LABORATORY.

DISINFECTANT FLUID AND POWDER.

(LAWES' CHEMICAL COMPANY, LIMITED, 59, MARK-LANE, E.C.)

BOTH this fluid and powder proved of standard and reliable strength in regard to the antiseptic and disinfectant contained in them. Thus the brick-coloured powder yielded at least 16 per cent. of active phenols, whilst over one-fourth of the liquid, which is an excellent type of this class of preparation—i.e., an alkaline mixture of resin and tar acid, which on dilution with water gives a uniform milk-like emulsion—consists of true phenols. Inert tar oils are so often contained in preparations vaunted as disinfecting fluids and powders that it is satisfactory to report in regard to the above preparations their freedom from such useless components. In the light of these results we were not unprepared to find that experimental evidence had demonstrated the powerful bactericidal properties of both products, more especially of the fluid.

FOODS FOR THE DIABETIC.

(E. BLATCHLEY, 167, OXFORD-STREET, W.)

As is well known, there is now made a large and excellent assortment of foods which are well adapted to the requirements of patients suffering from diabetes, but amongst the

² THE LANCET, June 30th, 1894.

most satisfactory farinaceous substitutes which have recently been proposed is probably soya flour, and still later aleuronat, which is a flour containing from 80 to 90 per cent. of vegetable albumen and but 7 per cent. of carbohydrate. The care and attention which Messrs. Blatchley have given to these special requirements, especially in regard to palatability, has already been exemplified in the excellent preparations which they have from time to time placed at the physician's disposal, while further examples are afforded in some recent preparations which they have submitted to us, which have for their basis either the comparatively recently isolated albumen (aleuronat) or soya flour, saccharin being added where sweetness is preferred. No. 1 biscuit is prepared from aleuronat, soya, bran, and eggs; No. 2 from soya, coker nut, and eggs; and No. 3 from almond, soya, and coker nut and eggs sweetened with saccharin. They are all quite free from starch, and the taste of each is satisfactory and such as would not lead to the slightest suspicion that the starchy materials which largely compose the ordinary farinaceous articles of diet are entirely absent.

BOISSELIER'S COCOAGENE.

(C. BARRY & Co., 30, ROPEMAKER-STREET, E.C.)

"Cocoagene" consists of round compressed tablets, thicker than, but about the dimensions of, a two-shilling piece, which are composed (according to our analysis) of perfectly pure cocoa, with a large proportion of the indigestible fat removed. They contain no foreign addition, the alkalinity of the ash (4.49 per cent.) being only equal to 0.52 per cent. of potash. The form in which cocoagene is made renders it most convenient for preparing the excellent and nourishing beverage which pure cocoa affords.

BORINE ANTISEPTIC AND PROPHYLACTIC.

(MEDICAL NOVELTY COMPANY, 21, WEST TWENTY-THIRD-STREET, NEW YORK.)

Borine is a pale-yellow, spirituous fluid, and is described as "composed of the active constituents of benzoin, winter-green, meadowsweet, golden rod, and witch hazel, combined with the stearoptenes of wild thyme, eucalyptus, peppermint, and boracic acid." As an agreeable antiseptic for general purposes it possesses many advantages, not the least of which are its pleasant, fragrant odour and its harmlessness. It is well adapted as an effective and pleasant mouth wash, while it has also been advocated as a useful application in obstetric and surgical use.

CORROSIVE SUBLIMATE PELLETS.

(THE SANTAS CO., LTD., THREE-COLT-LANE, BETHNAL-GREEN, E.)

Each of these pellets contains corrosive sublimate in such proportion as to yield pint of disinfectant of the strength recommended by the Local Government Board. For this purpose they are, of course, extremely useful and convenient, but on account of their highly poisonous nature great care should be exercised in regard to their sale. In order to afford some precaution in this direction the pellets are coloured a deep indigo-blue.

New Inventions.

A NEW PORTABLE SECONDARY BATTERY.

THE use of electricity as an adjunct to diagnosis as well as a therapeutic agent when properly administered is now universally acknowledged, but heretofore the clumsiness and weight of batteries, both primary and secondary, have stood greatly in the way of its adoption by general practitioners. The secondary battery which Messrs. Miller and Woods of 2, Gray's-inn-road, have submitted to us is extremely handy and compact. It will either heat a cautery or

light a lamp; in the former case the cells are connected in parallel, in the latter in series. There is a separate rheostat for each purpose, so that the degree of light or heat can be accurately regulated.

When exhausted the battery can be easily recharged from the street main, if the supply is continuous and not alternating, by connecting the battery up from its lamp terminals to the light-supply, by taking the lead fuse out of a safety cut-out which controls an eight or sixteen candle power lamp and

bridging the gap with the battery instead of the fuse. The battery must be connected so that it works against the street current. This can be easily ascertained by noting the brightness of the interposed lamp. Connect the battery up one way, then reverse by changing the wires; whichever way the lamp burns most dimly will be right. The battery can be seen at any time at the establishment of Mr. T. H. Montague, 101, New Bond-street, and we can conscientiously recommend it to the profession as a very useful piece of apparatus.

THE SOCIETY OF APOTHECARIES.—The following changes have taken place in the staff of examiners of the Society of Apothecaries of London:—Mr. Bilton Pollard has been appointed one of the council examiners in surgery, vice Mr. A. Clark, who retires by rotation. Mr. C. B. Lockwood has been appointed one of the society's examiners in surgery, vice Mr. Bilton Pollard. Dr. T. D. Savill has been appointed an examiner in medicine, vice Dr. F. Warner, who retires by rotation; and Dr. Leith Napier has been appointed an examiner in midwifery, vice Dr. Lewers, who retires by rotation. Mr. Stonham has been appointed an examiner in anatomy, vice Mr. C. B. Lockwood.

On Tuesday evening, June 11th, a complimentary dinner was given by the members of the medical profession in Leamington and the neighbourhood to Dr. F. H. Haynes at the Regent Hotel, upon the occasion of his election as a Fellow of the Royal College of Physicians of London. Mr. J. R. Jeaffreson presided, and there were also present Drs. Thursfield, Thorne, Wyer, Douglas, Smith, Rankin (Warwick), Crowe (Worcester), S. W. Haynes (Birmingham), Tomkins, S. Browne, A. Bullock, B. Rice, Mason, and Olive, Surgeon-Major Hutton, Messrs. Fenn Clark, Morris, T. W. Bullock (Warwick), D. Rice (Southam), A. E. Haynes (Evesham), Growse (Kenilworth), Dickinson, Bradburn, Cowley Atkinson, and R. J. Pitt (Wellesbourne).

THE LANCET.

LONDON: SATURDAY, JUNE 29, 1895.

THOUGH the political crisis and the change of Ministry have put an end to all legislation on controversial subjects for the present Session, they do not affect the interest of the debate on the second reading of the Inebriates Bill. The interest of the motion for the second reading was in the fact that it was carried, and carried in spite of very serious speeches against such legislation by Lord HALSBURY, the Marquis of SALISBURY, and others. The jealousy of any interference with individual liberty is so great in this free country that it is only with the utmost difficulty that it can be in any degree overcome. The habitual drunkard has often his lucid intervals, in which alone he is seen by the world, and in which, too, he often appears to great advantage compared with other men. So that there is something in the proposal to interfere with his liberty which excites, and justly excites, the suspicion and the criticism of men of the world. Other insane people are seen to be so; he rarely. Yet his insanity may be as complete and as destructive of his own interests and those of his family as theirs. The habit may be so continuous, or the paroxysms so frequent and so overpowering; he may be so reckless of his own health, may show so utter a disregard for all decency, and so complete a want of consideration for all those whom he had formerly loved, as to make the word "liberty" in its application to him an absurd misnomer. In the case of the habitual drunkard liberty does not exist. As we have said, these cases are known only partially to the public. They are kept out of view, partly by kind friends and partly by their own glimmering of sense that they are not in a state to be abroad. But they are constantly seen by the medical man. Either the patient himself or his friends appeal, often pitifully, to him for something to be done to arrest a process of steady and often rapid degeneration in character and in health, leading, of course, often to an equally rapid degeneration in circumstances. The medical man is helpless. He tides the patient over an illness and explains to him or to her—for with painful frequency the patient is a woman—the nature of the disease which is assailing him or her. Very often he is rewarded for his faithful warning; but oftener he is not. The prescription of abstinence and self-control is received with apparent conviction and resolution, but he knows only too well that it will soon be forgotten, and that the paroxysms of alcoholic craving will recur till delirium tremens, or hæmatemesia, or other grave disease makes the patient cry a halt, but probably only when it is too late to save health, or character, or fortune. This is a sequence of events that is witnessed constantly by medical men, and it can only be accepted on their evidence.

There is, of course, a large number of cases among the poorer classes very pitiable in their nature which cannot be concealed, and the treatment of which constitutes a large part of the duty of the police magistrate. The cases mentioned by the Lord Chancellor are in point. Out of 33,000 women

sent to prison every year for drunkenness 11,000 had not less than ten convictions recorded against them, and of the men not less than 16,000 had each undergone not less than the same number of imprisonments. In one of the London prisons there were at the time of the return quoted 105 women who had been committed from 40 to 133 times in the course of a year. The number of convictions under the same name is not always a guide to the real number. The Lord Chancellor mentioned the case of a woman who had 400 convictions against her, but as her husband had paid £200 in her behalf she must have been 600 times for drunkenness at the police-court.

All medical men are agreed with the view of the late Sir ANDREW CLARK that in such cases short periods of confinement are almost worse than useless and that larger legal powers should be given for controlling and curing them. The severe opposition encountered in the House of Lords the other day was due rather to the fact that the Bill of the Lord Chancellor proposed to give powers of compulsorily detaining for a lengthened period—from one to three years—not only persons who had brought themselves frequently into the police-courts by their drunkenness, but persons who had not done so. Some of the saddest of these cases never appear in connexion with the police. And it is the proposal to give powers for their compulsory detention to a Judge, without the concurrence of a jury, that filled many noble lords—notably Lord SALISBURY—with alarm and led him to make what Lord KIMBERLEY called "too savage an attack" on the Bill. We should concede to the objecting lords any reasonable securities against the hasty action of friends, either from impatience or from more selfish motives. By all means let the judge—perhaps, as Lord SALISBURY said, "with a crank"—have a jury to check him. But, surely, it should be possible to devise some legal provision for the care and control of well-ascertained cases, which would, at the same time, protect cases of a more doubtful or less serious order from interference. The medical profession is not an exacting one. It takes a lenient view of human errors and infirmities, but it has long demanded that the existing Acts for dealing with habitual drunkards should be strengthened. It has no pleasure in mere incarceration or in unnecessary detention; but it aims at curing such persons, and it has a right to expect from the Legislature some help. Law is for the benefit of those who cannot save themselves, and if there is any such class it is that of the habitual drunkard.

In the *Edinburgh Review* an able writer discusses the question, Is meteorology really a science? "The answer," says the reviewer, "must depend very much on what we mean by the words. If meteorology consists merely in observing and recording temperatures and barometric pressures, it certainly is not a science; if it pretends—as it is not uncommonly supposed to pretend—to foretell the weather of the coming season, again most certainly it is not a science. But, if under the name of science we include the careful and systematic study of the meaning and import of natural phenomena, then assuredly the painstaking attempt to reduce

to some standard of comparison accurate observations of temperature, of atmospheric pressure, of wind force or direction, and the countless changes incidental to these, the endeavour to coördinate them, to discover their relation to each other, their interdependence on each other, which is what is properly understood as meteorology, is as much a science as astronomy, geology, chemistry, or magnetism, in every one of which there is still a great deal of uncertainty, a great deal of groping in the dark." We believe the distinction here drawn and the view expressed to be sound and just, and we have only one exception to take to the above passage. We imagine that no one above the vulgar level conceives that meteorology professes to foretell in advance the weather of any coming season. Every meteorologist will admit that this is impossible, and, so far as we can see, is likely to remain for ever impossible. What is practicable, what is year by year being achieved with constantly increasing accuracy and success, is by a careful survey of all the meteorological conditions present at any given moment to forecast the probable course of the weather during the ensuing day or two. Meteorology may, indeed, go a little further. During a period of prolonged drought or continuous rainy weather it may be possible by a comparison of the barometric pressures over a given large area—say that of Western Europe—for the meteorologist to say that his observations enable him to assert that the general conditions are tending towards a change either in the direction of settled fine weather or the contrary. But the limits of such prevision are very narrow, and nothing in the present state of our knowledge affords the smallest foundation for the hope that we shall ever be able to predict the probable state of the weather—say a month ahead. Those *soi-disant* weather prophets who announce long beforehand with so much assurance that we are going to have a very hot or cold, dry or wet, season are simply audacious pretenders. The writer in the *Edinburgh Review*, while expressing himself with due philosophic caution, indulges in an anticipation for which it seems to us there is but slender foundation. "There is," he says, "underlying all study of meteorological phenomena a hope that it may eventually lead to the calculation of future weather in the same way as—if things so unlike may be compared—the study of astronomy leads to the calculation of the rising or setting of the heavenly bodies, of their eclipses or occultations. But thousands of years had passed in patient observation before the motion of the heavenly bodies was understood, before the problem was solved by the intuition of COPERNICUS or KEPLER, and by the genius of NEWTON. When we reflect on the history of astronomy we may well be hopeful as to the future of meteorology, though the full knowledge may not come in the time of us, or our sons, or our sons' sons, and all that we individually can do is to go on slowly and laboriously accumulating observations of every conceivable kind, not knowing when or how any one set of observations may contain the key to the problem; even as in astronomy the observation of certain small, apparently trivial irregularities in the orbit of Uranus led to the discovery of Neptune." That meteorology will ever be found to obey laws comparable in mathematical exactness to those that

characterise astronomy seems to us, we confess, in a high degree improbable. On the other hand, it is impossible to doubt that meteorology does obey definite and invariable laws, and that our knowledge of these laws is only in its infancy. A shower of rain seems the most capricious of things, but we regard it very differently when we come to understand that the annual rainfall at any given spot on the earth's surface is practically invariable. The number of fine, hot days varies much from season to season, but the amount of heat received from the sun by any given locality in the year is a practically fixed quantity.

The leading features of the weather in the British Islands are determined by the prevalence of cyclones or anti-cyclones. Cyclones, we need hardly say, are rotatory movements of the atmosphere—the rotation in the northern hemisphere being against the hands of the clock—around a centre of low pressure, and are characterised by violent winds and heavy rain. They come to us from the Atlantic, travelling from west-south-west to east-north-east, and usually pass over Great Britain somewhere between Aberdeen and the Humber. The force of the cyclone, however, extends far beyond these limits and may be felt over the entire area of these islands. Anti-cyclones, on the other hand, are areas in which the wind rotates in the same direction as the hands of a clock around a high-pressure area, and are accompanied by light winds and fine, clear weather. Unlike cyclones, the anti-cyclones tend to be stationary. Two of the most common centres for anti-cyclones are northern Sweden and south-western Russia. "The normal weather system," says the reviewer, "of this part of the world in winter is a barometric pressure of about 29.9 inches, slowly becoming less towards the north and greater towards the south, with a gentle west or south-west wind and soft blue sky, with scattered flocculent clouds; any variation from this at once speaks of disturbance and calls for examination. The first symptom of an approaching cyclone is a rise—possibly a very considerable rise—of the barometer. This, if it comes from the westward, advancing eastward, is an almost certain prognostic, which is confirmed if the barometer, after its sudden rise, begins to fall as quickly as it rose." Of the causes of these cyclones, why they pursue a tolerably uniform course, why they always move round a centre of low pressure, nothing is definitely known. Of the many hypotheses framed to account for them we may quote the reviewer's statement of one. It is "that cyclones are formed in the great atmospheric currents like whirls in a mill-race; that the cyclones of the North Atlantic which reach our shores are formed off the banks of Newfoundland, where the cold wind from the north drives into the warm, moist wind from the south-west overlying the Gulf Stream. That such a clashing of currents will form a series of whirls is open to observation wherever one stream discharges itself into another, and that they will turn in the direction in which this other stream is going. It is equally open to observation that in such whirls there is a deep hole in the centre, and that the water is heaped up round the outer circumference. It may thus be possible that the cyclones are due primarily to the clashing of two currents, and secondarily to the profuse condensation and

precipitation so occasioned, each cause assisting and intensifying the effect of the other."

We cannot pursue the subject further at present, but our contemporary's article is noteworthy as proving that meteorology has at length made good its claim for recognition among the sciences.

SINCE MOLESCHOTT'S beautiful monograph on DONDER'S the medical world has not seen a worthier *immortelle* laid on the tomb of a professional brother than Professor MOSSO'S biographical sketch of KARL LUDWIG. Writing for an Italian public, the Turin physiologist has something to say of the condition of his science when forty-five years ago LUDWIG began his professorial career in the University of Marburg. Vitalism was then the accepted creed, entrenching itself behind the authoritative names of ALEXANDER HUMBOLDT, JOHANN MÜLLER, and JUSTUS LIEBIG; but LUDWIG, reinforced by DU BOIS-REYMOND, HELMHOLTZ, and BRÜCKE, began the steady mining operations by which that hypothesis has had to evacuate one stronghold after another, until, recalling science from the "high *priori* road," he placed it on the sure, if slow, track of observation and experiment by which alone the mysteries of life and death can be reached.

We need not recapitulate, even under Professor MOSSO'S brilliant guidance, the achievements of LUDWIG in research. These were sufficiently touched upon in our obituary notice of the master, when special importance was attached to the weapons he added to the physiologist's armoury—weapons by which nature, in disease as in health, is made the registrar of her own movements, particularly of the blood stream and of respiration. It is his testimony as a pupil, assistant, and eye-witness of LUDWIG and his work that gives Professor MOSSO'S reminiscences their present interest—testimony which, coming from an Italian, our readers will at once appreciate when he says that of all the nationalities by which LUDWIG'S laboratory was frequented, England supplied the largest number, "several of whom form around Professor FOSTER in Cambridge one of the prolific centres of activity in the study of life, and the chief glory of the great master." From this, by a natural transition, Professor MOSSO proceeds to note the services drawn from the same school by other foreigners and reviews the long list of Italians who owe to it their best inspiration and their soundest as well as most striking products. In this connexion he gives some interesting details as to his own work and that of his compatriot Professor LUCIANI of Rome (also a distinguished pupil of LUDWIG) on the prolongation of vital processes in the thoracic and abdominal viscera after life has "officially" been pronounced extinct. "I well remember the emotion that thrilled me when, experimenting along with LUDWIG, we found that twenty-four hours after death the life of the kidneys was not extinguished, that the sanguineous vessels could yet move, and that they reacted under the application of medicaments. The poetic dream of the resurrection has therefore a reality of its own in the mysterious complexity of the organs. Only the brain has yet defied physiological effort to wake it from

the sleep of death!" But, on passing from LUDWIG the experimental philosopher to LUDWIG the man and the citizen, Professor MOSSO has much to tell the world of the deepest interest. "LUDWIG," he says, "the greatest of vivisectioners, was president of the Leipzig Society for the Protection of Animals, and remained to the last one of its most active members." Germany owes it to him that her horses and beasts of burden are now humanely treated. To him is due that awakening of the true humanitarian spirit towards the brute creation that culminated in the "Verband der Thierschutz-Vereine des Deutschen Reichs" (Union of German Societies for the Protection of Animals). It was mainly from her sense of the gentler attitude to be encouraged towards animals on the part of the rising generation that Leipzig made him an honorary citizen on the fiftieth anniversary of his graduation in medicine. "No physiologist," continues Professor MOSSO, "has ever sought with greater frankness than he to impose just limits on vivisection. The gates of his institute were ever open to all who wished to assure themselves that he, in the midst of his experiments, knew how to spare suffering. The vivisectioner's art attained such perfection in his hands that, having to sacrifice an animal, he did not let it feel that it was even being tied. He would apply the muzzle and instantly proceed to the exhibition of ether or chloroform, which, in a few seconds, in a dog, for example, made it insensible. It is an error," adds Professor MOSSO wisely—"it is an error to believe that experiments can be performed on an animal which feels. The perturbation induced by pain in the functions of the organism is so profound as to render useless the experimenter's study. It was LUDWIG who uttered the celebrated *mot* that some physiologists, to study the nervous system, act like him who fires a pistol into a watch to see how the chronometer works. Suffering ought to be entirely eliminated from physiological experiment, because the instruments we employ to-day are so delicate that they become unserviceable the moment the animal is agitated or moves."

Illustrative anecdotes without number might be multiplied to prove the real humanity of LUDWIG—of the man who was denounced on anti-vivisection platforms as the "arch-fiend" of the "Nine Circles" and as the keeper of the worst "torture den" in Europe. Well may the physiologist and the physician call aloud, "Humanity! what offences are perpetrated in thy name." Professor MOSSO'S masterly "full-length" of a biologist, a teacher, and a philanthropic citizen, surpassed by none of his generation, ought to send a thrill of shame through the promoters of a mischievous propaganda which, mistaking sentimentality for sentiment, and morbid hyperæsthesia for sound feeling, would have tied the hands of one of the most beneficent students of nature who ever devoted his life to the healing art.

ROYAL STATISTICAL SOCIETY.—The sixty-first annual general meeting of this society was held on Tuesday, June 25th, at the society's rooms, 9, Adelphi-terrace, the Right Honourable Lord Farrer, President, in the chair. It was announced that the subject of the essays for the Howard Medal, which would be awarded in 1896, with £20 as heretofore, was as follows: "School Hygiene, in its Mental, Moral, and Physical Aspects." The essays should be sent in on or before June 30th, 1896.

Annotations.

"No quid nimis."

H.R.H. THE DUKE OF CAMBRIDGE.

THE announcement by Mr. Campbell-Bannerman in the House of Commons of the Duke of Cambridge's retirement from the position he has held for nearly forty years as Commander-in-Chief of the Army was in itself an incident of national interest and importance, but coupled with the fact that this announcement was directly followed by what practically amounted to a vote of censure of the War Minister himself, on a side issue relative to the reserve supply of small arms ammunition, and the subsequent fall of the Rosebery Government the circumstance was indeed a startling surprise. The intended resignation of his Royal Highness left the Government open to carry out a reorganisation of the War Office and army on the principles embodied in the Hartington Commission, and Mr. Campbell-Bannerman no doubt felt in going to the House that he held a trump card in his hand which he could play with most favourable effect as regarded his party; but the unforeseen is that which happens, as it did in the present instance. We cannot allow the announcement of the Commander-in-Chief's intention to resign his post to pass without a word from us on the subject. The Duke's services were spoken of in very eulogistic terms, and in many respects most deservedly so. An official after occupying a commanding public post for so long cannot sever his connexion with it without general manifestations of sympathy and many genuine expressions of regret. That the Duke is a kindly dispositioned man, that he had the welfare of the army, and especially that of the private soldier, at heart, that he honestly did his best, and that he possessed a wonderful knowledge of all military detail and strong common sense we have no doubt. But it cannot be denied, on the other hand, that he has reached an advanced age, that he has been younger—we will not say abler—men compulsorily retired, who had done the State good service in different fields and various climates, and that he has enjoyed the fruits and advantages of his office for a very long time. It is impossible that the physical and mental energies, the receptive faculties for new ideas and modern lines of thought and action, and the promptitude of judgment should remain the same in old as in middle age, and the Commander-in-Chief has, therefore, in our opinion, as a Royal Duke, consulted the interests of the Queen and his own dignity, as well as the interests of the public, in acting as he has done. Whether any changes will be brought about affecting the medical service by the creation of a new office and the appointment of a successor is more than we can tell. The Commander-in-Chief has not been invariably credited in his relations with army medical officers with full comprehension of what the department needs, but we are quite sure that he nevertheless carries their best wishes for his health and happiness.

THE ABOLITION OF THE CONTAGIOUS DISEASES ACTS.

IF it be desirable to know how the action of our Government with regard to the Contagious Diseases Acts is looked upon in France, we have an excellent opportunity for enlightenment in a communication which was read at a meeting of the Académie de Médecine in Paris on May 21st last by Dr. Commenge. The documents furnished in England by the Minister of War, said the speaker, have brought the gravity of the case into prominent relief. In 1892, out of 196,336 soldiers 52,155—that is to say, upwards of a quarter of the entire British army—were admitted to hospital on

account of venereal disease. In the opinion of the majority of army medical men this extraordinary development of the venereal diseases is with justice to be ascribed to the abolition of the Contagious Diseases Acts; and even the late Dr. Graham Balfour, who was for a time opposed to the regulation of prostitution, changed his views on this point. It will be interesting to draw a comparison, continued Dr. Commenge, between the existing state of affairs in England, where prostitution is free, and that obtaining in France, where, happily, some proscriptive measures still remain in force. In 1875, the year that venereal diseases were most prevalent in the French army, the number of cases was equal to 74.5 per 1000 of strength; during the same year in England the proportion was 139.4 per 1000. The highest rate in the British army is referable to the year 1885 and amounts to 274.4 per 1000; in the French army that year the numbers yield 52.1 per 1000 only. When we examine the returns in order to ascertain the prevalence of syphilis, the following are the results. In the French army the worst year for syphilis was 1875, when the proportion of cases was 11.3 per 1000 of strength. In the British army during the same year it was 28.8 per 1000, and in 1887, when the highest ratio was reached, it was 46.6 per 1000. In France during the latter year the syphilitic rate was only 8.9 per 1000. Dr. Commenge has, moreover, made a study of the sanitary condition of the Russian army, where venereal affections maintain about the same level that they do in the French army, save that syphilis is slightly more prevalent. Needless to say, prostitution in Russia is under the control of the authorities. The relative prevalence of venereal disease in the three armies is shown in the subjoined table, the figures giving the cases per 1000 of strength:—

	England.	France.	Russia.
1889	217.1	45.8	40.7
1890	212.4	43.8	43.0
1891	197.1	43.7	41.5
1892	201.1	44.0	44.6

The following table shows the comparative prevalence of syphilis alone:—

	England.	France.	Russia.
1889	35.7	9.1	12.9
1890	37.3	9.1	13.4
1891	32.2	8.9	12.2
1892	33.8	9.2	13.7

Dr. Commenge next extended his investigations in order to determine the sick rate in the several divisions of the French army, and found that the incidence of venereal disease was largely influenced by the presence or absence of clandestine prostitution in the various garrison towns. Paris, Algeria, and "the Midi" were notorious centres of illicit intercourse, and it was in these districts that the venereal rate invariably attained its maximum. Dr. Commenge brought forward a formidable array of facts and figures in support of his thesis, which was pronounced to be an eminently interesting and instructive work. His conclusions are three in number: 1. Venereal diseases are always far more numerous in countries where there is free trade in prostitution than in those where regulations are in force. 2. The regulation of prostitution serves to attenuate the virulence of the venereal diseases and to hinder their progress. 3. The results now adduced are in accordance with the resolutions of the Académie de Médecine voted in 1888, when the attention of the authorities was drawn to the dangers of prostitution and to the necessity for safeguarding the public health.

A MEDICAL TARIFF FIXED BY LAW.

THERE is a Bill before the Legislative Council of the Cape of Good Hope, a short Bill to amend the Medical and Pharmacy Act of 1891, which provides a tariff of fees for

medical practitioners. No practitioner will be entitled to recover any charges exceeding those in the tariff, "save in pursuance of any special agreement between the parties."

SCHEDULE.

TARIFF OF FEES FOR MEDICAL PRACTITIONERS.

Examination of any person, and certificate	£1	1	0
Every visit within the limits of any town or village—				
By day	0	5	0
By night	0	10	0
Every visit outside such limits, besides the charges allowed by the tariff—				
If travelling at own cost: per hour	0	10	0
If travelling at cost of patient: per hour	0	7	6
Any confinement	3	0	0
Any certificate of cause of death not involving post-mortem	0	10	0
Any surgical operation involving the loss of any limb	10	0	0
Any ordinary surgical operation	0	10	0

It cannot be said that this tariff errs on the side of excess. It is very vague. "Any ordinary surgical operation, 10s."! It is very doubtful, too, whether the Legislature is acting wisely in fixing fees. Practitioners who most respect themselves will make their own terms. We shall be curious to know whether such a Bill becomes law.

THE SEARCH FOR A CANCER PARASITE.

THE contribution which Dr. Braithwaite makes to our columns this week adds one more to the list of investigations in the quest for the parasite which is assumed to be at the root of the most formidable class of diseases to which mankind is subject. The labours of histologists have shown that in their structure malignant growths are capable of being classified under certain well-defined groups, according to the type of tissue or organ in which they arise. But histology is silent as to the initial stimulus which gives rise to these aberrant cell masses, as well as to the remarkable potentialities with which they seem to be endowed, so that recurrence *in loco* and general dissemination by the circulating fluids constitute a peculiar characteristic of malignancy. If in these respects malignant disease bears some resemblance to the characters of tubercle, syphilis, and like infective disorders the analogy is purely superficial. For in every member of the class of infective disease the anatomical lesion is limited to the type of inflammatory or granulation tissue, and in none does it partake of the character of the more highly differentiated cells which are to be found in cancers and sarcomas. In the one case the influence of the microbe is confined to exciting changes, which we term "inflammatory," and the dissemination of the foci of disease is restricted to the territories in which the parasite finds a lodgment. If, then, "cancer" (using the term in its widest sense) be also caused by a parasite it must of necessity be an organism which is endowed with quite special powers, for no histologist could declare that there was any real analogy between the processes of aberrant cell-growth in a malignant tumour and those of the small indifferent cells that constitute a tubercle or a gumma. Hence the failure of attempts to extract from malignant tumours by bacteriological methods any organisms of the bacterial class is hardly a matter for surprise. More hopeful of satisfactory result in this search would seem to have been the alleged discovery of cell parasites of protozoic nature; but here, unfortunately, so far the only test that could be applied has been the morphological one, and in spite of the numerous and painstaking researches and the beautiful demonstrations of intra-cellular bodies which have been made it behoves us to be extremely cautious in accepting these bodies as the parasites in question. Similar caution is also needed in regard to the fungi which Dr. Braithwaite has found, and which apparently belong to the class of hyphomycetes. The spores of such fungi abound in atmospheric dust, the readiness with which they germinate is notorious, and although Dr. Braithwaite assures us that he has found their mycelial threads penetrating the substance of neoplasms (recent and preserved) there is room for scepticism when it

is remembered that mould fungi are not infrequently found mingling with tissues on the microscopic slide. Apart from any fallacy of this kind, however, it is well to recall that similar fungi have been found in the body—e.g., in the lungs—and have been introduced into it experimentally, with the result that they have either been quite innocuous or have merely excited some local inflammation. If Dr. Braithwaite's inferences are correct, then the fungi he describes should show some peculiarities, according to the kind of malignant growth in which they occur, since it is not to be supposed that one and the same organism could excite the formation of a uterine myo-fibroma, an epithelioma, and a sarcoma. It would be interesting to learn the opinion of a botanist upon the fungus, for if this discovery be confirmed—and the research, as compared with that for the protozoal parasite, is simplicity itself—quite a new light will have been thrown on the *role* of parasitic fungi.

SWALLOWING A DENTURE.

THE dangers of the custom prevalent with some people of going to sleep without removing artificial teeth have been illustrated in a striking manner by a case reported by Mr. J. Maxwell Wood in the *British Journal of Dental Science*. A servant girl aged eighteen went to sleep wearing a plate measuring 1½ in. by 1½ in., the attachments being two short gold bands. In the morning the plate was nowhere to be found, and later in the day the advent of a pain in the stomach convinced the owner of the plate that she had swallowed it. On confiding her case to her mistress that lady at once sent for the family medical man, and also, with more zeal than judgment, gave the girl a large dose of castor oil. On the medical man arriving he found that the plate had been passed within an hour of the taking of the oil. That the patient had a very narrow escape both from her accident and its treatment is obvious. Probably she suffered from the usual complaint of her class, chronic constipation, and thus the purgative effects of the oil would do far less mischief than in a case where it would have brought about liquefaction of the feces.

LIFE INSURANCE OF CHILDREN.

THE withdrawal of Sir Richard Webster's Bill for the regulation of children's insurances does not of course imply either its abandonment or any distrust of the principles upon which it is founded. It is evidence merely of a laudable desire on the part of its author to ensure the permanent utility of his measure by allowing further time for the full consideration of all trade interests which might be affected by it. Despatch in this kind of business is best ensured by careful slowness at its beginning, even though the main features of the Bill may not call for material alteration. Some modification of its terms may, however, be desirable. In its present form it might in the minds of some not too friendly critics appear to suggest an unintended preference for workmen's benefit societies as compared with other more purely commercial companies. However this presentation of the case may express the practical result of inquiries into the use and abuse of this class of insurances, we are certain that no such direct espousal of a party interest was ever contemplated. What is intended is to so guard the method of insurance against possible abuses that it shall best fulfil the purpose for which it was instituted. We are aware that a distinction must in all cases be drawn between real and supposed causes and effects, and we will not deny that an understood connexion between infant mortality and loosely regulated systems of insurance may not constitute proof in a legal sense. After making every allowance, however, it is impossible to regard otherwise than with strong suspicion the fact that in many cases fatal neglect of children by drunken or vicious

parents in respect of food, medical treatment, and every ordinary rule of decency has gone hand in hand with an exact and careful payment of insurance premiums. Nor is it to be forgotten in criticising the terms of Sir Richard Webster's Bill that the sum assured is often much in excess of ordinary funeral expenses, nor that this excess, as also the association of neglect with mortality, has been observed more particularly in connexion with the non-mutual system. In an earlier issue of *THE LANCET*¹ we directed attention to certain safeguards which were, in our opinion, essential to the proper management of children's insurances. These included a strict limitation of the sum insured to funeral requirements, disqualification of the insured in any case of neglect or other culpable cause of death, and the observance of particular care in death certification. Any measure which would secure the interest of the insured children cannot, in our view, divest itself of these needful conditions. In the proposed Bill they are each provided for. There is a form of insurance which deserves to be more widely known and utilised than it is at the present time. We refer to that which makes provision for some period during the life of the assured, commonly fourteen years of age or later, with the option of a reduced payment in the event of death at an earlier date. It is to be hoped that this scheme of endowment will become increasingly popular. In it we find the true resource of thrifty parents, anxious not so much to meet the pecuniary difficulties entailed by death and burial, as to employ creditably the greater probabilities of life, health, and work.

DIAGNOSIS FOR NOTIFICATION PURPOSES.

A VERY interesting case has been tried at Oldham under the Notification Section of the Oldham Improvement Act, 1880. Dr. George Thomson was summoned before the Oldham Borough Police-court for having neglected to report the existence of typhoid fever at the house of Mr. John Edward Newton, J.P., Lynwood, Greenacres. The information of Mr. Tattersall, medical officer of health, stated that Dr. George Thomson, on May 14th and each succeeding day up to and including May 21st, wilfully and without reasonable cause, he being a medical practitioner called in to visit Lees, Arnold, and Doris Newton, and becoming aware that they were suffering from a certain infectious disease, typhoid fever, did not fill up, sign, and send to the medical officer of health a certificate or declaration of the same according to forms supplied by the corporation. Our readers will recognise at once the nature of the case against Dr. Thomson and the nature of his reply. It is necessary to state that at the time of these cases (May, 1895) influenza was prevailing, and that in one of them at least it appeared to have existed before the typhoid fever. In all it complicated the question of diagnosis and led to delay in notification. Dr. Thomson was called in on May 8th. On the 14th he began to think that he had typhoid fever to deal with and gave intimation of his suspicions to the parent, which seem to have become known to Mr. Tattersall, who visited the house on the 21st and accidentally met Dr. Thomson, who told him quite frankly of the facts and of his views, but added that in the early stages the cases had been difficult of diagnosis and had simulated influenza. The whole unseemly and unnecessary controversy arose from a remark of Dr. Thomson to the effect that on the 14th he had "diagnosed" typhoid fever, but had delayed notifying till he should be sure of his ground. The exact words used were a matter of dispute. But there is no dispute as to the general position which he took up, in which he was supported strongly by the parent, by Dr. Dreschfeld of Manchester, by Dr. Robertson of Oldham, and by Dr. John Hodgson, and which is simply that on the 14th he made

what Dr. Dreschfeld happily called a "provisional" diagnosis (what we should call a "working" diagnosis), on which all necessary precautions were taken, and then waited a few days for the confirmation of that. A diagnosis for working purposes is one thing in such cases, and an absolute diagnosis is another. In the Metropolitan Asylums Board hospitals 25 per cent. of cases certified as enteric fever turn out to be otherwise, and in the course of this case at Oldham it transpired that in the Monsall Hospital during the last epidemic of influenza more than one half of the cases sent as typhoid fever turned out not to be such. Of course with such evidence the magistrates came unanimously to the conclusion that Dr. Thomson had not wilfully and without reasonable cause offended against the Act. They dismissed the case, but only allowed £5 as costs, which we think was scarcely fair to Dr. Thomson. However, he and the medical witnesses will have the satisfaction of having vindicated the rights of medical men to be masters of their own minds, and to determine the time when they shall make such a diagnosis as they will not have to regret. We are not apologists for any disloyalty to the Notification Acts or any unfaithfulness in the discharge of duties under them; but these duties are difficult and highly responsible, and they involve on the part of sanitary authorities, and especially of their medical officers, sympathy with medical men and consideration for their difficulties.

SIR JAMES REID, K.C.B.

THE consciousness of having done one's duty, of having relieved, if only in an infinitesimal degree, some of the vast amount of sorrow and suffering, is popularly supposed to be the medical man's reward, and this ideal is frequently held out in introductory addresses at the opening of medical school sessions. These rewards, however, appeal only to the recipient, and it is always satisfactory to be able to chronicle a more worldly remuneration as well. Therefore we have pleasure in congratulating Sir James Reid upon the honour which has been conferred upon him in the shape of a Knight Commandership of the Bath, an honour received at the hands of Her Majesty on June 21st. Sir James Reid was appointed to the office of Resident Physician in 1881, and on the death of Sir William Gull in 1889 was appointed Physician in Ordinary to the Queen.

"CLERICAL BREAKDOWN."

At a recent meeting of the Clergy Home Mission Union Sir Dyce Duckworth read an admirable paper on Clerical Breakdown, of which an abstract will be found in another column. His idea of a diocesan medical officer to report on all candidates for ordination and to certify to their physical fitness for clerical duty is, we think, a most sensible suggestion. "None with any defects or tendencies to disease should be passed unless they were possessed of independent means." These, of course, could devote themselves to doing good work for the Church by literary work or studying and improving ecclesiastical music. "Weakness and inability," said Sir Dyce Duckworth, "heavily handicap any clergyman. He misses his full training, and from the almost inevitable mawkish sympathy on the part of parishioners is only too likely to degenerate into a valetudinarian." We are glad to think, however, that the race of Honeymans, with their "devoteapots"; of the pale young curate who could say—

"Had I a headache, sighed the maid assembled;
Had I a cold, welled forth the silent tear;
Did I look pale, then half the parish trembled;
And when I coughed, all thought the end was near."

has almost completely passed away. The parish priest of to-day is a real worker, and the butterfly of the proprietary chapel has vanished together with the lavender kid gloves, the glass of water, the cambric handkerchief, the large Bible,

¹ THE LANCET, JAN. 19th, 1895.

and the gold watch, which used to be thought necessary for the delivery of a sermon. Sir Dyce Duckworth asked his hearers why they did not sometimes, if pressed, read another's sermon, acknowledging the source. Why, indeed? we may ask; and we might add, Why should there be more than one sermon on a Sunday? To expect a man to compose about two hundred carefully thought out and well-expressed discourses in a year is ridiculous, and yet it is what the average parish priest is expected to do if we include all holy days. Neither should the clergy be worked to death by being made a sort of relieving officer. "Alms," it is true, "do purge away sin," but the distribution of them should be handed over to a church council, of which the parish priest should be the *ex-officio* head.

"BOARDS OF GUARDIANS AND NURSING."

WITH reference to an annotation which appeared in our columns a few weeks ago¹ under the above heading, and which had reference to a very undesirable state of things in a workhouse in South-west Sussex, the board of guardians at their last meeting adopted the recommendations of the visiting committee without any discussion whatever. An epitome of the committee's recommendations was given in the annotation, and, bearing in mind the great importance of the majority of them, entailing as they do a considerable outlay, it certainly reflects the greatest compliment possible upon every member of the committee that their report should be confirmed absolutely without a word; and apparently, as a further compliment, the board gave the committee full power to carry out their recommendations. No time is being lost in removing all the defects, and this particular workhouse should soon be in a position to afford an example for the whole country as regards the nursing of the sick—at any rate, it will give a very good idea of the immense value of the Local Government Board circular issued at the beginning of the year.

LIGHTNING STROKE.

THE indifference with which the inhabitants of large cities pursue their business during the most "terrific" thunderstorms, unmoved by any feeling of danger and inconvenienced only by the rain, contrasts strongly with the awe with which the countryman contemplates the passing storm, and the precautions, almost superstitious in mountainous and moorland districts, which he takes with the view of avoiding a thunderstroke. But the different attitudes are fully justified by facts, the deaths from lightning among the urban populations being far fewer than those caused by runaway horses; for chimneys, church towers, telegraph posts and wires all serve to divert and divide the currents, so that even when one or other is struck the accident is rarely attended by any loss of life, and the streets are among the safest places in a storm. In the country it is quite otherwise; the chimneys of isolated houses, the trees surrounding a homestead, the hedgerow, the barn, the stack under which a man takes shelter, or his own person if he be overtaken in the open, act as so many conductors to attract and concentrate the spark—indeed, the solitary traveller or field labourer is less exposed to danger under trees than when he presents the only "point" in a wide "plane." Dr. Brämer, who has endeavoured to collect and tabulate the circumstances of all deaths from lightning in Germany during the last fifty years, finds that they have been nearly trebled in that period, a phenomenon which he attributes to the increased activity as well as numbers of the rural population. Village churches and schools contribute a remarkable excess of accidents during the hours of service or

instruction, as if the aggregation of a number of human beings intensified the danger, possibly by the internal air currents set up. The metal bells might also attract, and the old practice of ringing the church bells during storms has of late years been discontinued; while both causes, the massing of men and of steel, concur to render military encampments peculiarly liable. One-third of the annual average of accidents occurs in July, and the afternoon, or 3 to 9 P.M., gives the highest, and the corresponding period of 3 to 9 A.M. the lowest, number, the actual maximum being reached between 3 and 4 P.M., although the six hours immediately preceding—viz., 9 A.M. to 3 P.M.—contribute fewer than the midnight watches of 9 P.M. to 3 A.M. The popular fear of causing movements or currents of air by driving or running is not unreasonable, but the continuous series of telegraph posts and wires, and of metal rails, render a railway train about the safest possible refuge in a storm.

THE LATE MR. GEORGE SMITH OF COALVILLE.

REGRET for the death of Mr. George Smith "of Coalville" will not be limited to the circle of his intimate friends. Mr. Smith was the natural representative of a class of men whose value is understood wherever forethought, sincerity, and disinterested effort are duly recognised. Labouring in the midst of much difficulty, misinterpreted by those whom he sought to benefit, opposed by hostile interests, uninfluential save in his humane resolution, he was able to bring under the wholesome sway of education, and within the range of the other benefits which civilisation offers, a race of nomad children of whose existence society before was hardly conscious; in the Canal Boats Act we possess a monument of his beneficent energy.

CATTLE TROUGHS AND CONTAGION.

It has repeatedly been asserted that the sanitary reputation of street cattle troughs is not above suspicion. The St. Pancras Works Committee have gone a step further than mere assertion, and have ordered the removal of all such troughs within the parish and the erection of stand-posts in their stead. This action, we are told, has been taken in consequence of the representations of the Master Carmen's Association and others, who maintain that the present arrangement encourages the spread among horses of contagious disease. It is impossible to state with precision how far this view is supported by observed facts. The question is, nevertheless, a very important one and well worthy of becoming a subject of careful investigation by local authorities. In speaking of contagious disease in this connexion the mischievous influence of glanders is at once forced upon our attention. Its prevalence, especially in large stables, its highly infectious properties, the susceptibility of the human subject, and the strange fact that notification of this deadly disease has been entrusted to the horse owner's uncertain intelligence, will suffice to explain the energy shown by the St. Pancras Committee. It must be admitted that their zeal is in this instance not without excuse. On any warm day several equine heads may be witnessed absorbing simultaneously the contents of one and the same trough wherever these are found, and the spectacle is, to say the least, suggestive. Cab horses are largely indebted to the Metropolitan Drinking Fountain Association. They are like wise more particularly susceptible to glanders from the fact that many of them are usually stabled together. Such facts as these cannot be overlooked in dealing with the question before us. If they teach anything it is the relative advantage of providing each animal with a separate water-supply. An extensive change of plan such as would be required to effect this object must necessarily be carried out with due

¹ THE LANCET, May 25th, 1895.

deliberation. It would also be rendered more thorough by the knowledge derived from a preliminary inquiry into the proof of statements adduced in its support. While admitting all this, however, there can be no doubt, we feel assured, that a new arrangement of stand-posts, with stop-cocks, pails, and gully-holes for the removal of refuse water, would serve every useful purpose cheaply, effectually, and with a nearer approach to sanitary success than the trough system.

PHYSICIANS IN THE OLDEN DAYS.

IN the *Gentleman's Magazine* for July Mrs. J. E. Sinclair contributes an interesting paper embodying a good deal of research upon Old-time Physicians. She quotes, amongst other things, the following treatment that used to be meted out to quacks. "A counterfeit doctor was set on horseback, his face to the horse's tail, the same tail in his hand as a bridle, a collar of jordans about his neck and so led through the City of London with ringing of basins and banished." If only the same thing could be done now the traffic of Cheapside would have to be stopped in order to let the procession pass, but the latter-day quack flourishes exceedingly, and advertises at large in the public press.

THE "INDEX MEDICUS."

IN another column will be found a letter from the Resident Librarian of the Royal Medical and Chirurgical Society concerning the imminent decease of that invaluable publication, the "Index Medicus." When it is remembered that this work is a carefully classified index of the whole of medical literature, not only books but pamphlets and original articles in the medical journals, and that on a reference to it any articles which have been written on medical subjects can be easily found, it will be seen that the cessation of this work would be an incalculable loss. Our correspondent's suggestion that £400 a year should be subscribed by this country is well worth the consideration of the profession and the medical societies, and as such we commend it to them.

THE CAIRO LUNATIC ASYLUM.

"EVERYTHING comes to him who knows how to wait" is a motto of very necessary application for English reformers in Egypt. Difficulties which have existed for the last ten years have now been brushed away, and Dr. Warnock has been installed as the pioneer psychologist of Egypt, although it is true that the native heads of the Government have stipulated that Dr. Warnock's appointment is to be only for two years. Though it is only three months since he arrived, he has already mastered some colloquial Arabic and has set about a number of changes which were of obvious need. Previously some 300 men and 150 women were allowed to sit idly on their beds all day without any means of occupation. Now there may be seen some of the patients engaged in the garden, laundry, and kitchen, while a few work as tailors, carpenters, and basket-makers. The paid gardener has been dismissed as a needless luxury, and his place is supplied by a monomaniac who has believed for years that he is the true Mahdi and now willingly works for the daily wage of a few lumps of sugar. The asylum has been kept very clean for some years, but efforts are now being made to improve its ventilation—efforts which are the more necessary because it must remain overcrowded until some outflow for incurable cases be provided. A post-mortem room has been fitted up, and necropsies are now regularly held by the four native medical men who have been appointed as assistants. There are a few paying patients, and their number will probably increase as the fame of the medical superintendent spreads. Criminal lunatics are not unknown, there being generally four or five

homicides among the inmates, who have, as a rule, killed their mothers or other near relatives. Acute melancholia and suicides are very rare, and so also is general paralysis.

IN THE MATTER OF MR. T. R. ALLINSON.

MR. THOMAS RICHARD ALLINSON, of Spanish-place, Manchester-square, appeared at the Marylebone Police-court on Tuesday last, before Mr. Curtis Bennett, to answer a summons issued at the instance of the General Council of Medical Education and Registration for describing himself as a licentiate in medicine. Mr. Muir Mackenzie conducted the prosecution. Mr. Allinson's name, it will be remembered, was removed from the Medical Register in 1892, on substantiation before the Council of the charge that, being a registered medical practitioner, he systematically sought to attract practice by a system of extensive public advertisements of a character discreditable to a professional medical man, containing his name, address and qualifications, and invitations to persons in need of medical aid to consult him professionally. The action of the General Medical Council was later upheld in the High Court of Justice and in the Court of Appeal; and, if the twenty-ninth clause of the Medical Act (1858) has any force and meaning, it was a foregone conclusion that the disciplinary tribunal of the profession would be found to have taken the only proper legal course. Mr. Allinson, however, has continued to use the affix giving him a legal title to practise, and for this he was summoned by the Council, with the result that he has been fined £20 and £10 10s. costs or a month's imprisonment in default, Mr. Bennett considering the case a bad one and refusing to entertain an application to state a case. The profession will be glad to recognise by the issue of this case that the General Medical Council is watchful not to allow its decisions to be ignored with impunity.

THE INFLUENCE OF TROPICAL CLIMATES ON MENSTRUATION.

WE have received a copy of a paper dealing with this subject by Dr. Joubert, Professor of Midwifery at the Eden Hospital, Calcutta. It is well known that menstruation appears at an earlier age among the natives of tropical climates than in England, and the impression has been that this was due to the influence of the climate. Dr. Joubert has collected statistics on the subject and he finds that there is very little difference as regards the age at which menstruation appears between Europeans and Europeans born in India who have lived all their lives in that country. Among the natives, however, menstruation does appear at an earlier age than among Europeans; for instance, of the cases referred to in Dr. Joubert's paper menstruation appeared in girls between twelve and thirteen years of age in 36.4 per cent. of the natives, while it only appeared at this age in 13.4 per cent. of Europeans, and in only 10.8 per cent. of Europeans born and reared in India. According to Dr. Joubert the cause of this difference is not to be ascribed to the climate, but to the different social customs prevailing among the natives, and especially to the absence of all privacy in the domestic life of an Indian household, which allows children to become acquainted with sexual matters. Thus, he says, when attending a pregnant or lying-in woman he has often had to ask that the children of both sexes who were present should be sent away. Indeed, from his knowledge of the country Dr. Joubert says he doubts whether there are any little girls or boys who have reached the age of ten years without having a pretty accurate knowledge of what the sexual relations and child-bearing really mean. We think that Dr. Joubert has made out a very probable case for thinking that

climate has comparatively little to do with the early appearance of menstruation among the natives in India. It would be interesting to know, however, whether among races living in colder climates, but under similar social conditions as regards want of privacy, &c., a similar precocity as regards the age at which menstruation appears has been observed.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

At the meeting of Fellows on the 4th prox. the President will report that the alterations to By-laws, Section 4, 18, and 25, have been approved by the Secretary of State. He will further report that the Council, in accordance with the opinion of the legal advisers of the College, do not deem it expedient to accede to the resolution passed at the meeting of Fellows in January, requesting the Council to appoint a joint committee of members of the Council and other Fellows of the College to consider the desirability of obtaining a new Charter. No notice of any private motion has, we understand, been given.

THE LONDON COUNTY COUNCIL AND INSANITARY PROPERTY.

An inquest was held this week concerning the death of a woman who resided in a house in Bethnal-green which was described as being in a filthy and insanitary condition, and which, it was stated, was in the ownership of the London County Council. The chairman of the Public Health Committee of the Council was, at the usual Tuesday meeting of the Council, questioned on the subject, and promised that a report by the Council's medical officer as to the condition of the premises should be presented to the Council at its next meeting. The house, it appears, is one of a number of houses still remaining on the Boundary-street area now being cleared by the Council, houses which have in effect been condemned and are waiting their turn for demolition. Efforts have been made to displace the population gradually and to provide new buildings in substitution for those demolished. Whether there is justification for the continued occupation of the house in question after its acquisition by the Council remains to be seen. Probably it will turn out that the Council, like other landowners, have been quite unable to get the poor creatures inhabiting the hovels which have just come under their control to leave the property.

DIPHTHERIA IN LONDON.

MATTERS do not tend to show much improvement in respect of the prevalence of diphtheria in the metropolis, the records of the fortnight ended June 22nd displaying a succession of deaths greatly in excess of the preceding like periods for some time past. Taking the four-weekly periods since the beginning of April of the present year we find that the respective numbers have been 107, 145, and 156 deaths from diphtheria in London county. These data are therefore exclusive of the numerous deaths which took place in the three months in Greater London. In the three weeks ended June 8th the deaths had been 37, 41, and 33 respectively, but in the succeeding week they rose to 45, being thus 15 above the corrected average for the like week of the preceding decennium. Of these deaths, which were some 25 per cent. of known cases in the week, all were in young persons aged under twenty years, and 31 were in children aged between one and five years. The parishes of Fulham and Lambeth had each 5 deaths credited to them, and the areas of Poplar and Camberwell had each 4 deaths, Rotherhithe having 3. Last week the fatal cases dropped somewhat—namely, to 37—but they were still above the corrected average by 6, and with the exception of one

were in persons aged under twenty years, the period one to five years supplying 26 deaths. There were 4 deaths in Mile-end Old Town, and 3 each in Fulham, Shoreditch, Battersea, Greenwich, and Bermondsey. The admissions to the hospitals of the Metropolitan Asylums Board have been gradually increasing in recent weeks, the removals having been 88, 86, 107, and last week 128. In like manner the cases remaining in hospital have shown continual increase in the last eight weeks, having in that period grown from 432 on April 27th to 492 on May 25th, and further to 593 last Saturday. In Greater London the deaths in the last fortnight have been as many as 17 and 15, and those occurring in West Ham district have been respectively 9, and for last week 8, in Canning Town, and 7 in Leyton subdistricts of West Ham registration district.

A COMPLIMENTARY dinner was given to Mr. Christopher Heath at the Langham Hotel on Tuesday, June 25th, by his old house surgeons in recognition of his position as President of the Royal College of Surgeons of England. The guest of the evening was presented with a handsome silver tray as a token of esteem and affection.

A PATHOLOGICAL meeting of the Neurological Society of London will be held on July 11th. Members wishing to contribute are requested to communicate with the honorary secretaries (Dr. Howard Tooth and Dr. Fredk. W. Mott) as soon as possible.

At the Oxford Commemoration held on June 26th Professor Michael Foster and Sir W. H. Flower, K.C.B., received the honorary degree of D.C.L.

ON CLERICAL BREAKDOWN.¹

BY SIR DYCE DUCKWORTH, M.D., LL.D. EDIN., F.R.C.P.,
PHYSICIAN AND LECTURER ON MEDICINE, ST. BARTHOLOMEW'S
HOSPITAL; HONORARY PHYSICIAN TO HIS ROYAL HIGHNESS
THE PRINCE OF WALES.

LET me say at the outset of my remarks that I am deeply sensible of the responsibility I undertake at this moment. To address a body of clergy under the shadow of this majestic Christian temple on the subject of their health requires that I should so speak as to justify my words before a doubly searching criticism, one from your body and one from my own profession. I propose to say nothing of the truth of which I am not convinced, and I will, in advance, crave indulgence for any expressions that may not entirely commend themselves to you or to the general body of the clergy. The subject of my address is one which may well enlist the interest of those I now see before me. I may tell you that the words of my text—Clerical Breakdown—were not chosen by myself, but were given to me as the subject allotted for consideration at this particular meeting of the Clergy Home Mission Union. I therefore venture to believe that you are familiar with the term. Yet it appears to convey something like a stigma upon the clerical profession. We have not yet adopted this term in medical nosology, and it is possible that when we do we may have to add legal, medical, mercantile, and other varieties of breakdown. In truth, we well know what the term means, but you may be sure that your profession has no monopoly of the troubles indicated by it.

It may be affirmed that each profession or vocation has, as might be supposed, its own peculiar line or lines of breakdown; or, in other words, we find men submitting to the inevitable laws of nature and suffering various penalties as the result of a vain endeavour to discard or supersede them, for that is too often the source of breakdown. To maintain health is to conform to the laws of nature, which are the laws of God, and it is as much an article of religion to observe these as it is to obey any other Divine injunction.

¹ Being a paper read at the meeting of the Clergy Home Mission Union, in the Chapter House of St. Paul's Cathedral, on June 12th.

My profession assents to this, and in its name I will here and now repudiate the dictum that was once uttered against it, never true at any time, as I believe, and certainly not true now, *Ubi tres medici, ibi duo atheni*. The temptations that beset you, as they do all men who are earnestly engaged in good work, are to neglect self and to spend and be spent for others, and thus to go beyond the bodily and mental power which the organism is capable of producing and maintaining. This over-expenditure may be tolerated for a time, but it will not fail to leave its mark on the constitution. I think it is probable that the clergy break down nowadays in larger numbers than formerly. The Church has awakened in the last forty years to a fuller sense of the claims that are rightly made upon her, and the clergy, as a body, work far harder than they were wont to do. The activities of the modern parish priest were little witnessed when I was a boy, and the days of sinecures are well-nigh over. The old fox-hunting and port-wine-drinking parson is almost as extinct as the dodo, and even the higher dignitaries of the Church are, if anything, nowadays over-active and distracted with petty details. The modern bishop is nearly on a par with a railway guard as to the mileage he covers, and any sedentary life now possible in the Church is very properly left for such decanal authorities as have literary tastes. Such an increase in activity, however, is but commensurate with a like increase in other activities, and forms part of the modern phase of intense life which is characteristic of this end of the century. The physician takes note of it and observes its results in his daily work. Robustness of mind not uncommonly goes together with the same quality of body, and the Church has sore need of both. I am far from declaring that a *mens sana* is only to be found in a hardy and robust body, but I will venture to affirm that we more commonly meet with mental twists, eccentricities, and "fads"—all of which are to the physician indications of mental debility—in the possessors of feeble bodies and poorly developed nervous systems. I do not know that it would be a bad plan for each bishop to appoint a diocesan medical officer to report on all candidates for ordination, and to certify to the physical fitness of each for clerical duty. None with any defects or tendencies to disease should be passed unless they were possessed of independent means. The Church and her work would gain more than she would lose by such a course. Without doubt many men are now ordained who are only fit for light duty, for a life in a healthy country parish, or to officiate in small churches. If such men can find their appropriate places and their necessary environment there is no harm done. Weakness and inability are not qualities to be commended in any person, and any clergyman thus constitutionally disposed at the outset of his career is heavily handicapped. He seldom acquires the full training requisite for an active parish priest, and by mawkish sympathy on the part of some parishioners—which is almost inevitable—he is only too likely to degenerate more and more into a valetudinarian. At this stage he perhaps marries. His wife becomes by degrees a badly trained sick-nurse for him, and troubles grow thicker. The poor man is coddled and petted, stuffed with food, and developed into an object of parochial solicitude. As I shall presently show, this pitiable condition may be reached by men who are not naturally delicate. What is to be done with the younger clergy who start on their career with indifferent health or a feeble constitution? In many cases a career in a salubrious colony may be advantageous, and even life-saving in the case of those with a phthisical tendency. Certain foreign chaplaincies are available for a few, though it is not fair that our expatriated invalids should only command the clerical services of persons little stronger than themselves, for not seldom in such spheres there is need of strong and active men to represent Anglicanism as a robust and wholesome branch of Christendom.

We have now to consider the cases of those who, starting with an adequately vigorous constitution, sooner or later begin to fail in health as a result of their mode of clerical life. There are several varieties of break-down to which the clergy are more particularly prone. First, I will mention sore-throat. Clerical sore-throat can be little benefited save by attention to general health, by diminished amount of speaking, and by instruction as to the right methods of producing the voice. The weak part will be helped by attention paid to the whole body, and exercise and other means of securing vigour must be had recourse to. One line of break-down all too common amongst the clergy is that of the

digestive system. A fertile source of this is irregularity in the hours of meals, especially in the later part of the day. The calls and claims of parish duties often appear to necessitate these irregularities. The clergy sometimes make themselves not the servants but the slaves of their parishioners, and are at home to them at all hours on the most trifling pretexts. I note next a cause of breakdown with which I am not unfamiliar, and which must be enumerated in a survey of this subject. I allude to the weakness and disability induced in some of the clergy by an unwarrantable degree of abstinence in the season of Lent. I am not here to touch upon any questions of conscience or of Church discipline. I am too loyal to the width and comprehensiveness of the Anglican Branch of the Catholic Church to presume to commend or to condemn such practices as are ordered with Scriptural warranty by the Church, which practices may be either shibboleths or stones of stumbling to this man or to that. But with a full appreciation of the motives which lead to a Lenten asceticism, it is my duty to say that I can sanction no humiliation arrived at by a positive injury to the bodily organism. I do not believe that a chastened and ill-nourished body commends itself or its works to its Creator, and I conceive it to be the first duty of everyone to keep his health at all times at the highest level. An ill-fed brain is sure to go wrong. Abstinence is sometimes overdone and harm comes of it. This leads me to allude to the custom of receiving the Holy Eucharist fasting. This may be done without harm to health by many, but as the circumstances of the fast must vary very much it is not a practice that can be urged or enforced on all. As a beginning of a day of heavy work I think the practice, for most of the clergy, unwise. I recommend them and the laity to take a cup of good cocoa or tea before leaving home, and I am sorry for the scruples of conscience that anyone may have who objects to this. In any case, as a physician I give this advice in the matter and leave the theologians to do as they like.

After prolonged and monotonous spells of work, and often after irregular and unmethodical work, with inadequate holiday and change of scene, a low state of health may gradually supervene, indicated by listlessness, mental depression, want of zest for work, and feelings of exhaustion. It is always undesirable to fall into this condition. Relief is at first commonly sought by way of domestic remedies, and it is believed that strength may be gained by extra feeding and supplies of stimulants. Sir Andrew Clark used to say that many of the clergy were simply poisoned by their wives with repeated doses of beef-tea and wine given between meals, always with the best intentions. It is certain that no course can be more harmful than this. A thorough holiday and a change of environment, together with a proper dietary, will set all to rights, and the sooner full work is resumed afterwards the better. Improper use of stimulants may be made in conditions such as I have just mentioned, and unwholesome habits may thus be begun. There is, and can be, no rule of universal applicability in respect of the use of stimulants. Here and now I will only say that a little good wine is, in my opinion, very useful for men who are working hard in cities and towns, taken only with one or perhaps two meals in the day. I lay stress on the words *little* and *good*, because I know that harm comes from inattention to either word. Men working in the country may often do without any stimulant, but there is no fixed rule to be laid down. I add, further, that I have known it to be unwise for men who have reached the age of forty to change their simple habits in regard to stimulants and to take to water or temperance drinks, and I confidently affirm that most of the latter are as unwholesome and undesirable as can well be. For those who elect to set the example of abstinence—and all honour to them—I would say, begin early in life if you have any change to make in your habits. The medical, like the apostolic, precept, however, in this matter, the precept of good sense for the great majority of mankind, is to "let our moderation be known unto all men." In this injunction St. Paul, of course, makes no allusion to moderation either in food or drink. The original word used may nevertheless be fittingly applied to the temper of mind in which the great alcoholic question should be approached and considered: *eruentis* may for this purpose be translated fair-mindedness, or, in Matthew Arnold's words, "sweet reasonableness." With this principle to guide them the clergy and others may, I think, turn a deaf ear both to the nonsense so constantly declaimed from

so-called temperance platforms and to the vulgarities and impertinences of Sir Wilfrid Lawson. I have known excessive tobacco-smoking to lead to dyspepsia and bad health in certain of the clergy. Here, again, it is only necessary to commend moderation. The habit grows by indulgence, and I have met with the worst cases in men who have been lazy in their parishes, men who wear their slippers all day, live in their studies, and grow into indolence and grooviness. A robust parish priest is not likely to over-smoke. Grooviness is to be avoided, and times for due relaxation are to be set apart. I much approve the Bishop of Winchester's advice to his clergy on this point. He recommends as much of one day in the week as possible to be devoted to relaxation and change of scene, and one evening in the week at least to be allotted to the social side of parochial life. In this way a clergyman comes to know and influence his flock more effectually than by constantly appearing amongst them officially. His presence is to brighten and purify the occasions of family gatherings and festivities, and to set the lesson how best to be in the world, and yet not be of the world.

I have long thought that shorter and more varied services would meet many of the difficulties you have often to encounter, and why some of you do not, when hard pressed, read the sermons of others, and tell the congregation whose words you are uttering, I do not know. Many evening services are too long after a hard Sunday's work. You and your people are all tired, and, once fatigue sets in, no good is to be done. For the clergy, as for other busy professional men, the key-note of life must be robustness both of brain and stomach, and robustness of muscle; and with these come wholesomeness of mind and a clear, right judgment. All this is very English, and if Anglicanism is to commend itself and win the day, as it surely will if we be true to it, the work will be done on the lines I have indicated, and "fads" and feebleness will fall away and leave us the victors—victors because we have obeyed the laws of nature, which are for us the laws of God. Remember, lastly, that in honouring your bodies you do honour to the shrine of God the Holy Ghost, Who dwells in them.

THE ANNUAL REPORT OF THE MEDICAL OFFICER OF HEALTH FOR THE ADMINISTRATIVE COUNTY OF LONDON.

II.¹

As an officer of the London County Council Mr. Shirley Murphy enjoys the privilege, that, inasmuch as the authority he serves is an entirely new creation, it is not, or should not be as yet, so hopelessly fettered by precedent as is unfortunately the case with some of our more venerable institutions. Mr. Shirley Murphy has, therefore, had the advantage of a free hand, not only in determining the form and general character which the important series of reports of which the second number is now before us should take, but also in devising such a comprehensive set of table charts and diagrams as shall most clearly and graphically illustrate the statistical details of the series. We are pleased to note that he has taken care to avail himself of certain of the more useful statistical devices which of late years have come into vogue for the elucidation of health problems. Thus, for example, we find that in deciding upon the age-grouping to be adopted in these reports he has found it expedient to abstain from deviating materially from the general usage of the Registrar-General, many of whose well-known tabular forms, charts, &c. have been introduced in this new series. In the supplement to the Registrar-General's report for the decennium 1861-70 Dr. Farr published the first life table ever constructed for London. Twenty years later the medical officer of health of the London County Council has constructed another life table for London, the basis being the

statistics of the decennium 1881-90. It should be borne in mind, however, that these statistics do not distinguish between the inhabitants of London who were born within the county and those who, having been born elsewhere, have migrated into London. Mr. Shirley Murphy's life table, therefore, deals with a population of avowedly mixed constitution living in London in the decennium 1881-90. As both of these life tables have been constructed on the same plan—namely, the "short method" of Dr. Farr—they are of course strictly comparable. The earlier table, however, does not show the expectation of life at the various ages; but, as these are important for purposes of comparison, Mr. Shirley Murphy has computed the expectations for the whole of the ages from five years and upwards. Before proceeding to compare the two life tables we may remark that by publishing his recent table Mr. Shirley Murphy has set an example to other health officers, which we hope they will not omit to follow. He has definitely shown that it is unsafe and absurd to compare the mortality of different areas, even in the same city, on the basis of the crude death-rates merely, without making allowance for the varying age constitution of the populations compared. It will be remembered that in the first annual report a table was given showing how the district death-rates may be approximately corrected for difference in age and sex composition of population. That table has, we are glad to find, been continued in the report for 1893. It is one of the best and most useful in the report. Mr. Shirley Murphy's new life table is given in two parts, Tables C and D. In Table C the survivors of 1,000,000 born, of each sex, are traced through life at each separate year up to five years of age and afterwards in quinquennial and decennial intervals up to eighty-five, the mean probability of living, and the deaths occurring in each age period being shown in separate columns. In Table D the survivors of 509,078 males and 490,922 females born are separately shown, and to these figures are added the future years of life which will be lived by the survivors at each age in the table; the expectation of life or average future lifetime at each age is also given. In Table E the survivors out of a million persons born, according to the two life tables, are instructively compared. It is surprising to find that, whilst in 1861-70 out of a million children born 305,518 died within the first five years of life, in 1881-90 only 309,495 deaths occurred within the first twenty years of life; the survivors at twenty years of age in the later decennium being, therefore, almost as numerous as the survivors at five years of age in the earlier. Table F shows that the expectation of life of males at five years of age has improved from 47.5 years to 50.8 years, and that of females at the same age from 50.9 years to 54.4. At subsequent ages there is in all cases an improvement, though relatively less than at age five, showing that the greater part of the life-saving takes place in the periods of youth and early maturity. Now that the initial labour of constructing a life table for the metropolis has been accomplished it will be easy to use the table in future as a means of comparing the mortality of each successive year with what we may term the standard rate of the London life table of 1881-90. In this way a useful record of progress or of regress will be available, which must prove of real and permanent value as a measure of the efficiency or otherwise of local sanitary administration.

Coming now to that very interesting section of the report which deals with the causes of death severally, we regret that considerations of space forbid our doing more than notice very briefly one or two of the points which Mr. Shirley Murphy has thought worthy of special treatment in his report. Statistical material of this kind lends itself but imperfectly to the condensing process, and we accordingly have no choice but to refer our readers to the report itself for

¹ Part I. was published in THE LANCET of June 22nd, 1895.

further information on what must be considered, from a medical point of view, the most important section of the work, treating as it does of the causes of the deaths of not fewer than 90,000 of our fellow citizens in the course of a single year. We have no difficulty, however, in selecting for exceptional comment Mr. Shirley Murphy's remarks regarding the part played by school attendance in relation to the spread of diphtheria and scarlet fever, two diseases which have in recent years shown increased prevalence in London, and therefore caused much trouble both to the school managers and to the hospital authorities of the metropolis.

Mr. Shirley Murphy gives tables showing the notified cases of diphtheria and scarlet fever in London, together with the mortality incidental thereto in recent years. The London death-rate from diphtheria in 1893 was more than double the rate in any of the largest English towns, except West Ham; it was ten times as great as the death-rate in Nottingham, and six times as great as that in Liverpool. But it is not until the age incidence of fatal diphtheria in London comes to be studied that a clue is afforded to the probable cause of the recent increase in the fatality of this disease. Statistics, the preparation of which must have cost much labour, have been compiled for the purposes of this report, and from a careful examination of these Mr. Shirley Murphy draws the following conclusions. 1. That antecedently to 1871-80, when the diphtheria death-rate at all ages was rising, the rate at school ages (*three to ten years*) rose in less degree than the all-age rate; and when the all-age rate was falling the rate at ages three to ten years fell in even greater degree than the all-age rate. 2. That in the decade 1871-80, with a general decline of the diphtheria mortality at all ages, there occurred at ages three to ten years a relatively higher diphtheria death-rate than before—that is to say, the diphtheria mortality at ages three to ten years did not fall in 1871-80 in anything like the same degree as did the diphtheria mortality at all ages. This new departure is most conspicuous in London, but it is also noticeable in a less degree in other parts of the country with which London has been compared. If the metropolitan rates of 1891-93 are contrasted with those of 1855-60, it is found that in 1891-93, while the all-age death-rate had increased 313 per cent., that at the ages three to ten years had increased 457 per cent.; and again, if compared with the rates of 1861-70, it is found that the all-age death-rates in 1891-93 had increased 196 per cent., whilst that at the ages three to ten years had increased 309 per cent. Now it is important here to note that in 1871, the year immediately following that in which the Elementary Education Act first came into operation, there was in London a noticeably increased incidence of diphtheria mortality at school ages, which increase has been maintained ever since and has in later years been much accentuated. With the object of ascertaining, if possible, how far school attendance is influencing the spread both of diphtheria and scarlet fever in London, Mr. Shirley Murphy has constructed diagrams showing the registered weekly number of cases of diphtheria and scarlet fever respectively in relation to the mean weekly number for the entire year. For this purpose the cases of both diseases notified in 1893 have been divided into three classes: (a) those occurring in children under three years of age, (b) those in children from three to thirteen years of age, and (c) those in persons above thirteen years old. The sick cases may therefore be considered in relation to school operations, these three groups representing practically (a) those who are too young to attend school, (b) those at the school period of life, and (c) those who have for the most part left school. Accordingly, curves have been constructed showing the number of cases occurring in each of these groups; and in respect of both diphtheria and scarlet fever practically the same important fact at once

becomes apparent—namely, that in the four weeks of August, 1893, there was a most remarkable depression in the curve for all ages, the depression being much more strongly accentuated in the curve relating to children of school age. These diagrams show clearly that, whatever the cause, there was in 1893 a sudden and noteworthy diminution in the prevalence of diphtheria and scarlet fever in London during the period which corresponds generally with the closure of the London Board schools, and that very shortly after their reopening early in September an almost equally serious increase in the prevalence of both diseases took place.

Having regard to the limited period for which returns of notifiable infectious diseases are as yet available in London, we are not surprised that the county medical officer of health contents himself for the present with placing before the Council the facts bearing upon the important subject of school attendance in relation to the spread of certain communicable diseases. When, however, the facts for a few more years are forthcoming, we shall hope to hear more on a subject which is of transcendent importance, whether viewed in relation to public health or to elementary education.

THE EXHIBITION OF HYGIENE AND CONGRESS ON PRACTICAL SANITATION AT PARIS.

THE Exhibition of Hygiene¹ will be inaugurated at Paris by M. Félix Faure, President of the Republic, on the 27th of this month. We have already explained that this Exhibition was organised in view of the new law which compels all houses in Paris to drain directly into the sewers, for as yet only 5447 blocks of buildings out of about 80,000 are drained in this manner. In view of this great reform, a reform which will be extended as rapidly as possible to provincial towns, a new sanitary society has been formed in France. It is called the Society of Sanitary Architects and Engineers of France. Its headquarters are at 10, Cité Rougemont (Hôtel des Ingénieurs Civils), and its object is to group together those architects and engineers who have studied questions relating to practical hygiene, to encourage such studies, to spread knowledge of hygiene among the artisans engaged in these professions, and to bestow such honours and recompenses as may stimulate the knowledge of sanitation among those concerned in the practical realisation of sanitary reform. In the execution of this programme the society in question has determined to hold a "Congrès d'Assainissement et de Salubrité" at the Exhibition of Hygiene. The opening of this Congress will coincide with the inauguration, at which the members of the Congress will assist, of the vast irrigation grounds and sewage farm of Achère on Sunday, July 7th. The sittings of the Congress will be held in the *locale* of the Exhibition—namely, the Palace of the Liberal Arts at the Champs de Mars. Though not, strictly speaking, an international congress, foreign adherents will be heartily welcome, and members from Belgium, Denmark, England, and Spain have already been enrolled. The admission fee is twenty francs, to cover the cost of printing the report of the Congress and its free distribution to members. All communications should be addressed to the Secrétariat Général du Congrès, Palais des Arts Libéraux, au Champs de Mars, Paris. Anyone taking an active part in sanitary reform can become a member of the Congress. It is needless to say that this Congress is patronised and encouraged by the French Government, and that its members will have a unique opportunity of studying and visiting all the sanitary services in Paris, as also the Exhibition, to which they will be admitted free of charge. One of the principal subjects of discussion will be the drainage of small towns or large villages. This is a phase of sanitation which has been, comparatively speaking, neglected. The other subjects are the treatment and utilization of domestic slops; the rules that should govern private

thoroughfares; public baths; the conditions governing the application of syphon traps to the interior of inhabited dwellings; the disposition of rooms in dwellings; the necessity of an effective control of the sanitary services in private dwellings; the rational warming of dwellings; the professional teaching of hygiene; and the unification of methods employed in drawing up sanitary statistics. The latter subject will be treated by Dr. J. Bertillon, Chief of the Paris Statistical Department. On most of these questions printed reports will be distributed to the members before the Congress meets, and these reports will be discussed at the morning sittings. In the afternoons private members may introduce other questions for discussion. This Congress will, in conjunction with the Exhibition, have the advantage of lifting sanitary questions out of the domain of mere theory, and of compelling everyone to face and study the difficulties of practical application. As an ounce of practice is worth a pound of theory the Exhibition and Congress should be well supported.

A MATTER OF ETIQUETTE.

WE publish below what we may hope is the final correspondence in a matter to which we have previously referred upon several occasions—namely, the relations between the Vestry of St. George's, Southwark, and Dr. Waldo, their medical officer of health. To recapitulate shortly, the Vestry demanded of Dr. Waldo that he should revise other medical men's certificates, unknown to them, for they were not always satisfied with the certificates submitted. Dr. Waldo refused absolutely to commit such a breach of medical etiquette. He appealed to the Local Government Board, and the Board has decided that he is right. We congratulate Dr. Waldo on the stand he has made for courtesy and righteous dealing. Now the case of the School Board and its discourteous resolution of May 30th stands on exactly the same footing. The School Board has appointed medical men to revise other medical men's certificates, presumably unknown to the original authors of the certificates, and at the bidding, moreover, of the divisional superintendent, a layman. It is to be hoped that the Education Department will convey to the Board an opinion that the Board have acted in, to say the least of it, an impolitic manner. The question, we suppose, will come up at the forthcoming meeting of the Board, and if the Board is wise it will rescind a resolution which ought never even to have been submitted. The following is the correspondence alluded to above:—

St. George-the-Martyr, Southwark.

Vestry Hall, Borough-road,

May 23rd, 1895.

To the Secretary,
Local Government Board.

DEAR SIR,—I am desired by the Vestry of St. George-the-Martyr, Southwark, to ask the advice and guidance of your Board in the following difficulty:—

When Dr. Waldo was appointed medical officer in the year 1892 he signed the enclosed list of regulations, and in accordance with Regulation No. 19 he bound himself to visit professionally the employes of the Vestry when sick, as the Vestry allow sick pay, and they are not always satisfied with the medical certificates submitted, for they fear that malingering is not unknown. In carrying out this regulation, Dr. Waldo finds himself in a position of difficulty. If he calls on any employé without communication with the medical attendant who gave the certificate, he informs the Vestry that he will be guilty of a serious breach of medical etiquette, and if he gives notice to the employé's medical attendant and arranges a formal consultation the Vestry feel that the value of such visit will be lost, and they will be involved in considerable expense.

If Dr. Waldo finds himself obliged to report to the Vestry that the certificate of the medical attendant was not justified by the patient's condition, his relations with the local medical men will become strained and his work as medical officer of health suffer. Some members of this Vestry, on the other hand, are of opinion that the Post Office, the large supply associations, and some large friendly societies, require that visits (with the object of detecting malingering) should be paid by their own officers. They see no reason why Dr. Waldo should not accordingly fulfil the terms of his

engagement, without prejudice to his status in the medical world and without offence to medical etiquette.

Yours faithfully,

(Signed) A. MILLAR, Vestry Clerk.

Local Government Board, Whitehall, S.W.,

June 12th, 1895.

SIR,—I am directed by the Local Government Board to acknowledge the receipt of your letter of the 23rd ult., relative to the duty undertaken by Dr. F. J. Waldo, the medical officer of health for the parish of St. George-the-Martyr, Southwark, "to attend, if required, the flushers and sewers men and other employes of the Vestry during illness," and requesting the Board's advice and guidance in the difficulty which has arisen in regard thereto. The Board have carefully considered the representations on the subject submitted in your letter and in the report of Dr. Waldo which accompanied it.

On the general question the Board would observe that as regards duties of a somewhat analogous character which at times devolve on the medical officer of health under the Infectious Disease (Notification) Act, they have laid it down that even when question arises as to the good faith of a certifying medical practitioner the medical officer of health should, if it becomes necessary to revise a certificate, not only seek the co-operation of the medical practitioner concerned, but should also observe, as far as possible, the customs that usually govern the relations of medical practitioners to each other. On the particular case submitted in your letter of the 23rd ult. the Board do not gather that the undertaking entered into by Dr. Waldo "to attend if required" on certain employes "during illness" involves any obligation on his part to revise either the diagnosis or the certificates granted by other medical practitioners who have been called in to attend on such persons. I am, Sir, your obedient servant,

(Signed) W. E. KNOLLYS,

Assistant Secretary.

A Millar, Esq., Vestry Clerk, Borough-road, S.E.

THE ASSOCIATION OF FELLOWS OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

A MEETING of the committee of the Association of Fellows of the Royal College of Surgeons of England was held at 101, Harley-street, at 5.30 P.M., on June 26th. Mr. T. Holmes, one of the Vice-Presidents, occupied the chair, in the unavoidable absence of the President, Mr. George Pollock, and there was a large attendance of members of the committee. The minutes of the last meeting of the committee were read and confirmed. The honorary secretary, Mr. Percy Dunn, reported that he had duly issued the circular-letter addressed to the Fellows adopted at the previous meeting of the committee. He then read letters from five Fellows of the College desirous of being elected as Members of the Association. These were proposed and seconded by members of the committee and unanimously elected.

The honorary secretary reported the proceedings at the deputation to the committee of the Council which took place on the 10th inst., as already reported in THE LANCET of June 15th. In reference to this matter the honorary secretary reported that the deputation had been asked by the committee of Council to draw up a *précis* of the arguments adduced in favour of their propositions for amending the charters and by-laws, and that the subcommittee appointed by the committee of the Association at a recent meeting had already commenced this *précis* and now submitted it to the committee. After some discussion, the committee approved generally of the work of the subcommittee, and requested them to complete it as soon as possible.

A resolution was proposed, seconded, and unanimously passed, expressing the hope that all the members of the Association would record their votes in favour of Mr. Willett, Mr. Norton, and Dr. Ward Cousins.

With respect to the annual general meeting of the Association it was decided that the date should be fixed by the committee after the election at the College on the 4th prox.

This concluded the business of the meeting, and the committee adjourned.

METROPOLITAN HOSPITAL SUNDAY FUND.

WE continue below our record of some of the principal amounts received at the Mansion House, the lists of which have been received at THE LANCET Office, up to the time of our going to press on Thursday, when the total sum received amounted to nearly £31,000. At the corresponding period last year the total was £26,500.—

	£	s.	d.		£	s.	d.
St. Michael's, Chester-square (Canon Fleming), with additions	1175	9	0	Highgate Parish Church (Rev. J. M. Andrews)	72	0	6

MOKATTAM: A SANATORIUM FOR CAIRO.

By GREENE PASHA.

SOJOURNERS in Egypt—and in these days, whether as seekers after health or merely on pleasure bent, their name is legion—must know the Mokattam heights, must be familiar, by sight, at all events, and by name, if not from actual excursion, with the flat-topped range of nummulitic limestone hills that overlook the city of Cairo to the south-east, forming an effective background for the picturesque cluster of battlemented buildings known as the Citadel. Elevated some 400 or 500 feet above the plain, the summit of Mokattam consists of a plateau in three tiers, so to speak, each tier being fairly level, and the three collectively constituting a superficies sufficiently extensive for the accommodation of a large suburb, but arid and desolate to the last degree for lack of water. Not many visitors ever take the trouble to scale the breezy heights, because there is "nothing to be seen" as a recompense for the climb except an obsolete fort and a second-rate ruin or two. In a land where objects of interest exist in such profusion on every side, and are withal so readily accessible, it is not considered worth while to encounter a somewhat tiresome ascent, but the few who do expend a portion of their superfluous energy to this end are amply rewarded by the view, which, beyond all comparison, is the most magnificent in Egypt.

The usual route to Mokattam is along a causeway that was originally constructed for military purposes in connexion with the above-mentioned fort, and although this pathway, which opens out directly behind the citadel, is both precipitous and dilapidated, it is nevertheless accessible to that wonderful and long-suffering animal, the Egyptian donkey. There is also a more circuitous and considerably longer road, with an easy gradient, which a small outlay would render practicable to the ordinary Cairo Arabiyeh; and should the requisite enterprise be forthcoming a funicular elevator could with the greatest facility be constructed in connexion with an existing railway that traverses a deep cutting at the foot of the hill. In India wherever there is raised ground in the neighbourhood of a town or cantonment it is promptly taken advantage of for the erection of hot-weather bungalows, but the idea of so utilising the Mokattam plateau seems never to have seriously occurred to the European community of Cairo. That such neglect of a great natural advantage should have prevailed under the old régime is perhaps comprehensible; but it certainly does seem a strange thing that the Anglo-Indians, who are now so comparatively numerous in Egypt, should have taken no steps in the matter. When our countrymen feel that they require change of air—a respite, as it were, from the foul smells and coprophagous microbes of the undrained city—they betake themselves to Helouan or Matarieh and even make little of the nine miles to and from Mena at the foot of the Great Pyramids; but the notion of a sanatorium close at hand, in the pure atmosphere up above their heads, and within easy reach of the various Ministries and public offices, has altogether escaped their ken; and, yet, as has been suggested, the scheme could be so readily carried out—there are absolutely no difficulties in the way, and the boon to the whole population would be enormous. The aerial project could be made an actual reality with the utmost ease. A little energy, a little money, and the thing is done. A haven of refuge in sickness would be opened out for all, numberless lives would be saved, and European parents would be enabled to keep their children with them throughout the entire year, instead of having to send them home from the summer heats, as at present. A sufficiency of water could be raised by pumping, or possibly a supply might be conveyed in pipes by means of gravitation alone, if the intake were to be carried far enough up the Nile. Given an adequate water-supply and a ready means of access, there seems to be no reason why a Mokattam sanatorium should be condemned as utopian or impracticable. During the cholera epidemic in 1883 some of our troops were encamped on the hill, with excellent results; and I have heard of at least one English official¹ who had a tent pitched there in order to be able to sleep in a purer

atmosphere than the town itself affords. It would unquestionably be a great boon to the European inhabitants of Cairo in general if a healthy and easily reached suburb could be added to this city.

The following description of the view from the site of the proposed sanatorium is from the pen of an eye witness. As just said, there is "nothing to see" on Mokattam, but where in the wide, wide world can the view from its summit be surpassed? Let the spectator, provided with a good field-glass, take his seat near the edge of the well-nigh perpendicular cliff, in the shade of the ruinous old tomb that stands at the brink of the first terrace. Immediately beneath his feet is the citadel; he obtains a veritable bird's-eye view of the famous fortress, with its palaces and mosques, parade grounds, and umbrageous gardens. At the western verge of the parapet, the reputed site of the Mameluke's leap, stands the venerated temple erected by a solid enough man, Mohamed Ali, and called by his name—a hideous and incongruous edifice, redeemed from utter reprehensibility by its twin minarets, a pair of slenderest arrow-like pillars that seem about to wing their way into the blue sky above them. Many as are the minarets of the land of Egypt, there is none can compare with these for grace and symmetry. As delicate examples of lapidarian skill, or rather genius, their super-excellence is unapproachable. They may, as many say, be totally out of keeping with the remainder of the structure; they may, in the jargon of the day, be devoid of all *motif* and congruency, but in the humble estimation of one uncultured Philistine at least they remain things of beauty and a joy for ever. On the level ground, at the base of the old-world ramparts, stands the celebrated pile called the Mosque of Hassan, over which the dilettanti are wont to rave, though why the prison-like mass of masonry, with its huge up-and-down walls crowned by gigantic and minatory cornices, should evoke such unlimited enthusiasm is an insoluble mystery, more especially when I call to mind the damning fact that every stone in those walls was reft by shameless iconoclasts from the mighty monuments at Gizeh. To the right extends a labyrinthine mass of neutral tint constituting the native town—grimy and unlovely, it is true, on close acquaintance, but here happily embellished by the enchantment of distance. The swarming multitudes throng in and out and to and fro—as it were, a congeries of manikins. Backwards and forwards they glide in ceaseless motion, while, harmonised by space, arises the not unpleasant murmur of the restless tongues that at close quarters would be deafening. Here and there, in a more open space, a parti-coloured conglomeration of humanity seems to squirm and oscillate, being swollen or depleted the while by continually arriving or departing units; but should the eye select one of the latter to track to its destination—hey, presto! in a moment it has vanished from view, swallowed up in some narrow alley or dim arcade. On the left the modern division of the town expands in more gorgeous array, separated from the older part by the mighty artery which Mohamed Ali, with a characteristic mixture of despotism and enlightenment, drove straight through the heart of the labyrinth. The great avenue thus created is indeed an artery in the literal meaning of the word, and has rendered yeoman service to the city from a hygienic point of view, whatever may be said of it æsthetically. The autocrat to whom Egypt may be said to owe her existence simply issued an order, and lo! in the twinkling of an eye a thousand and one obstructions vanished; the destructive creator, if such a compound term be permissible, said the word, and a broad, straight, airy boulevard took the place of squalor and unmitigated crookedness. Further still to the westward are the modern habitations of the Ismailiyeh quarter, palatial in appearance, and for the most part standing in the midst of spacious gardens, where trees, shrubs, and creepers unite in producing a gorgeous display of floral treasure—of a truth ideal dwelling-places, save for the latticed windows and the lofty walls, the secluded harem, and the ostentatious Salamluk. On the extreme right is Abbasiyeh, the military quarter, with its extensive drill grounds, bounded on one side by the picturesque ruins known as the Tombs of the Kings, and on the other by the fertile fields of Matarieh. Across the entire picture, in the middle distance, flows the majestic Nile, his broad breast covered with the graceful sails of countless dahabiyehs, and spanned by a noble bridge at Kasr-el-Nil—sole relic of French predominance, in spite of the leonine effigies, so emblematic of

¹ Colonel Fenwick of the Police.

Britain's power, that guard the entrances. Beyond the bridge appears the playground of Ghezreh, sacred to polo, golf, cricket, tennis, racing; while further on is many-palaced Ghizeh, amidst acacia-shaded avenues and lovely pleasaunces. In the distance, to the north-west, the meandering river may be traced for miles through meadows of the most vivid green; and, to crown all, on the horizon the Pyramids stand out against the sky, completing the picture and imparting to it a distinctive character that elsewhere does not exist. The island of Rodah, too, in the left foreground, must not be omitted, with its quaint buildings and bountiful foliage; nor must the general effect and local colouring, due to the countless mosques and glittering pinnacles, remain unmentioned in this imperfect list.

It is easy to give a catalogue of details, but when it comes to a *tout ensemble* the difficulties grow well-nigh insuperable. How is it possible to convey an adequate idea of the glorious translucency, the exquisite clearness, of the atmosphere? What master of language could describe the blending of colours, the effects of light and shade, the thousand and one minutiae that at once appeal to the eye? The words of Byron express the scene better than any words of mine can do:

"The blue sky,
So cloudless, clear, and purely beautiful,
That God alone was to be seen in Heaven."

Public Health and Poor Law.

LOCAL GOVERNMENT DEPARTMENT.

REPORTS OF MEDICAL OFFICERS OF HEALTH.

Liverpool Urban Sanitary District.—The population of Liverpool, calculated on the assumption that the annual decrease observed between 1881-91 has continued, is estimated at 507,203. As, however, there has been a natural increase of 13,419 since 1891, it seems probable that the above inference is fallacious, and there are, Dr. E. W. Hope observes, strong indications for estimating the population at 531,397. Liverpool holds, Dr. Hope points out, a unique position as a purely urban municipality—i.e., one from which the natural suburban outgrowths are excluded, and which does not embrace within its registration area any semi-rural districts such as form part of other large towns. This fact is well shown by the density of population in Liverpool, which is twice as great as that of London, seven times that of Leeds, nine times that of Norwich, and fourteen times that of Huddersfield. The general death-rate of Liverpool was, for 1894, 23·8 per 1000, a rate lower than any yet recorded, save in 1888, when it was 23·1. The ward death-rates ranged during 1894 from 16·4 to 41·3. As instancing the effect which the age distribution of a population has upon its death-rate, Dr. Hope shows that if the population of Liverpool consisted entirely of persons between twenty and thirty the death-rate would be 7·8 per 1000; while if, on the other hand, it consisted entirely of children under one year it would amount to about 223·5 per 1000, and if above sixty years to 67·1 per 1000; and these rates would obtain quite apart from any change either way in the sanitary condition of the city. Comparing the number of cattle killed in the city slaughterhouse with the number of dead carcasses imported, it appears that during 1894 the number of cattle slaughtered was 6000 less than in 1893, a deficit which was made up for by the importation of 6000 dead carcasses. As regards sheep, too, we are told that during 1894 there was a decrease, as compared with 1893, of 51,000 in the number killed in Liverpool, while there was an increase of some 40,000 in the number of carcasses imported. These figures are certainly extremely interesting, and they raise some important questions in regard to the inspection of meat-supplies. *A propos* of this, we notice that in 1894 there were 1087 carcasses seized by the medical officer of health and the inspectors, and of these 214 were condemned in consequence of the animals having suffered from tuberculosis. In view of the recent report by the Royal Commission on Tuberculosis some observations as to the extent of the tubercle would have been of much interest; but doubtless Dr. Hope's very instructive report was in type before the Commission's report appeared.

"Charitable shelters" are, it appears, not unknown in Liverpool, and some difficulty has arisen as to their sanitary condition. Liverpool is, we are pleased to see, continuing her crusade against insanitary property, and Dr. Hope has recently reported on two circumscribed areas—one on the north and the other on the south side of the city. There are altogether 577 houses concerned, and it has been ascertained by careful inquiry that in three contiguous streets the death-rate is respectively 63·1, 67·0, and 71·4 per 1000. The houses, as a rule, consist of three rooms one above the other and connected by a staircase leading directly from one room into another. The houses are back-to-back and side-to-side, so that back or side windows are impossible. The property is, Dr. Hope states, in a general condition of dilapidation and ruin; "the outer walls and ceilings are stained by saturation with vapour of breath and are foul-smelling." There were fifty deaths from typhus fever in Liverpool last year.

Poplar Urban Sanitary District.—The Bow portion of this district has for the last twenty-one years been under the medical officership of Mr. R. M. Talbot, who in his current annual report furnishes an interesting contrast to the sanitary condition of the district in 1874 and 1894. The general sanitary condition of Bow will, Mr. Talbot states, "to-day bear the strictest investigation and compare favourably with any similarly constituted area in the world." Mr. Talbot has had considerable experience of the physical conditions of bakers, and he states that they are especially subject to chronic bronchitis, rheumatic gout, and cardiac weakness, all of which, he thinks, are in a great measure due to the nature of their occupation and the conditions under which their work is performed. The Poplar and Bromley portions of the Poplar district are reported upon by Mr. F. W. Alexander. He states that the condition of the Thames continues to improve, and as bearing upon this he refers to the capture of whitebait, jelly-fish, and shrimps off Erith, and the discovery of dace off Greenwich and Westminster. Mr. Alexander thinks that the Thames would quickly regain the name of "silvery" if the "West Ham sewage ceased to be discharged into the Lea and Thames, and increased sewer accommodation were afforded by the London County Council, so as to obviate the necessity of the numerous storm outlets, and if all other great sources of pollution were prevented." Unfortunately some of the "great sources of pollution" are made up of an aggregation of small pollutions which it is by no means easy to control while London maintains her position as the commercial centre of the world.

Portsmouth Urban Sanitary District.—Dr. B. H. Mumby records in his current annual report that during 1894 twenty-two cases of small-pox were notified. Eighteen of these showed good vaccination marks, and all recovered. The remaining four died, and of these three had never been vaccinated, while the fourth, if ever vaccinated, showed no signs of the operation. Truly, as Dr. Mumby remarks, in the face of such facts there should be no difficulty in getting children vaccinated. Unfortunately, however, the vaccination officer reports that he has every year an increasing difficulty in enforcing the Vaccination Acts. Diphtheria, we are glad to note, shows no signs of increasing in Portsmouth, and Dr. Mumby has observed that the greatest incidence of the disease is in those parts of the town situated on the London clay. Notification has now been in force in Portsmouth for eleven years, and during this period the death-rate for the four notifiable diseases has been reduced from 1·54 per 1000—the mean of the eleven pre-notification years—to 0·69, the mean of the eleven notification years.

Plumstead Urban Sanitary District.—With a view of impressing upon the public of Plumstead the fact that measles is a dangerous infectious disease, cards have been drawn up and distributed setting forth the necessity of taking proper precautions. Dr. Sidney Davies does not, however, consider that much good would result from adding measles to the notifiable diseases. Arrangements have also been made for disinfecting rooms which have been occupied by patients suffering from phthisis; but, although Dr. Davies informed all the local medical practitioners of the provisions which had been made, only three applications for disinfection were received up to the time of sending the annual report to press. An outbreak of scarlet fever occurred during 1894 among the scholars attending a certain Board school, and Dr. Davies's locum-tenent detected several previously unrecognized cases.

Croydon Rural Sanitary District.—Dr. Darra Mair's report

on the sanitary condition of this district is a very thorough one and bears evidence of much hard work. The statistical side of the report is especially well developed and should be of considerable local value. A remarkably mild epidemic of measles occurred during 1894 in the parish of Wallington, and although there were 336 cases notified but one death resulted. Unfortunately the initial cases were unnotified and were not discovered until the schools became implicated and the outburst occurred. The schools were closed on Oct. 3rd, and after the 20th of the same month no further cases were notified from houses occupied by the school children; school closure would therefore appear to have been of value in this instance. Measles, as will already have been gathered, is notifiable in the district now referred to, and Dr. Mair, as the result of the very considerable experience he has gained from the epidemic, thinks that any advantage gained from notification would accrue equally if the provision applied to infected houses only. He thinks that the saving in expenditure might be applied to the notification of diarrhoea and phthisis.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns 6604 births and 3284 deaths were registered during the week ending June 22nd. The annual rate of mortality in these towns, which had declined in the six preceding weeks from 17.7 to 15.4 per 1000, rose again last week to 16.2. In London the rate was equal to 15.1 per 1000, while it averaged 16.9 in the thirty-two provincial towns. The lowest rates in these towns were 6.8 in Croydon, 12.3 in Blackburn, 12.6 in Brighton, 12.7 in Norwich, and 12.8 in Newcastle-upon-Tyne; the highest rates were 18.9 in Halifax, 19.3 in Plymouth, 20.4 in Manchester, 21.4 in Oldham, and 25.1 in Liverpool. The 3284 deaths included 400 which were referred to the principal zymotic diseases, against 294 and 399 in the two preceding weeks; of these, 124 resulted from measles, 111 from diarrhoea, 67 from diphtheria, 49 from whooping-cough, 24 from "fever" (principally enteric), 23 from scarlet fever, and 2 from small-pox. No fatal case of any of these diseases occurred last week in Croydon, Norwich, or Burnley; in the other towns they caused the lowest death-rates in Sheffield, Halifax, and Salford, and the highest rates in Wolverhampton, Preston, West Ham, Liverpool, and Cardiff. The greatest mortality from measles occurred in West Ham, Plymouth, Cardiff, Liverpool, and Manchester; from whooping-cough in Gateshead; and from diarrhoea in Cardiff, Leicester, Preston, and Bradford. The mortality from scarlet fever and from "fever" showed no marked excess in any of the large towns. The 67 deaths from diphtheria included 37 in London, 5 in Liverpool, 4 in Wolverhampton, and 4 in Birmingham. One fatal case of small-pox was registered in Liverpool and 1 in Oldham, but not one in London or in any other of the thirty-three large towns. There were 22 cases of small-pox under treatment in the Metropolitan Asylum Hospitals and in the Highgate Small-pox Hospital on Saturday last, June 22nd, against 22, 23, and 19 at the end of the three preceding weeks; 8 new cases were admitted during the week, against 1, 5, and 2 in the three preceding weeks. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 1732 against 1524, 1589, and 1637 on the three preceding Saturdays; 251 new cases were admitted during the week, against 187, 179, and 199 in the three preceding weeks. The deaths referred to diseases of the respiratory organs in London, which had been 163 and 152 in the two preceding weeks, rose again to 186 last week, but were 31 below the corrected average. The causes of 51, or 1.6 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in West Ham, Bristol, Oldham, Newcastle-upon-Tyne, and in ten other smaller towns; the largest proportions of uncertified deaths were registered in Leicester, Liverpool, Burnley, and Bradford.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had declined in the three preceding weeks from 21.4 to 17.1 per 1000, rose again to 19.4 during the week ending

June 22nd, and exceeded by 3.2 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 16.0 in Paisley and 17.5 in Dundee to 24.0 in Perth and 24.3 in Greenock. The 560 deaths in these towns included 26 which were referred to diarrhoea, 20 to whooping-cough, 14 to measles, 7 to scarlet fever, 4 to diphtheria, 4 to "fever," and 1 to small-pox. In all, 76 deaths resulted from these principal zymotic diseases, against 57 and 58 in the two preceding weeks. These 76 deaths were equal to an annual rate of 2.6 per 1000, which was 0.6 above the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of diarrhoea, which had been 25 in each of the two preceding weeks, were 26 last week, of which 14 occurred in Glasgow and 4 in Dundee. The fatal cases of whooping-cough, which had been 11 and 12 in the two preceding weeks, further rose to 20 last week, and included 14 in Glasgow. The 14 deaths referred to measles corresponded with the number recorded in the preceding week; 4 occurred in Glasgow and 4 in Greenock. The fatal cases of scarlet fever, which had been 4 and 3 in the two preceding weeks, rose again to 7 last week, and included 4 in Glasgow and 2 in Edinburgh. The 4 deaths referred to diphtheria showed a slight further increase upon those recorded in recent weeks; 2 occurred in Glasgow and 2 in Edinburgh. The fatal case of small-pox was registered in Glasgow. The deaths referred to diseases of the respiratory organs in these towns, which had been 112 and 87 in the two preceding weeks, rose again to 94 last week, and exceeded by 28 the number in the corresponding week of last year. The causes of 41, or more than 7 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had been 22.1 and 23.1 per 1000 in the two preceding weeks, declined again to 20.1 during the week ending June 22nd. During the past twelve weeks of the current quarter the death-rate in the city has averaged 27.7 per 1000, the rate during the same period being 16.7 in London and 18.9 in Edinburgh. The 135 deaths registered in Dublin during the week under notice showed a decline of 20 from the number in the previous week, and included 16 which were referred to the principal zymotic diseases, against 11 and 8 in the two preceding weeks; of these, 6 resulted from small-pox, 3 from scarlet fever, 3 from diarrhoea, 1 from measles, 1 from diphtheria, 1 from whooping-cough, and 1 from "fever." These 16 deaths were equal to an annual rate of 2.4 per 1000, the zymotic death-rate during the same period being 2.2 in London and 1.9 in Edinburgh. The 6 fatal cases of small-pox registered in Dublin last week exceeded the number in any week since February last. The mortality from whooping-cough and from "fever" showed a decline from that recorded in recent weeks, while the 3 fatal cases of scarlet fever exceeded the number in any week since September last. The death referred to measles was the first recorded within the city during the current year. The 135 deaths registered in Dublin last week included 26 of infants under one year of age, and 29 of persons aged upwards of sixty years; the deaths both of infants and of elderly persons exceeded the numbers in the preceding week. Seven inquest cases and 6 deaths from violence were registered; and 50, or more than a third, of the deaths occurred in public institutions. The causes of 11, or more than 8 per cent., of the deaths in the city last week were not certified.

THE REPORT OF THE REGISTRAR-GENERAL FOR ONTARIO FOR 1893.

The report of the births, deaths, and marriages in the province for the year ending Dec. 31st, 1893, furnishes the usual amount of interesting statistics. The following are taken therefrom as showing the effect of these three factors upon our population. The following summary will show the increase and decrease of population by municipalities for the ten years from 1882 to 1892.

TOWNSHIPS.	
Increase in ten counties	29,672
Decrease in thirty counties	92,197
Total decrease	62,427

TOWNS AND VILLAGES.	
Increase in thirty-two counties	114,962
Decrease in seven counties	5,689
Total increase	109,873
CITIES.	
Increase in eleven cities	126,788
Decrease in one city	462
Total increase	126,326

That a decrease should have occurred in the rural districts of the province is a fact calling for serious attention on the part of the authorities. A total decrease of 62,000 in a rural population of 1,120,000 in 1882 does not speak well for a young country like Canada, and this to occur in the most populous province, where the pursuit of agriculture in some form or another is essential to our development and material progress, would seem to indicate a condition of affairs worthy of more than passing notice. It would seem that population in this new world is following the example set in the old—viz., a tendency to concentration of population in villages, towns, and cities, a fact with us greatly to be deplored. The birth-rate per 1000 is 19·8, the same as in 1892. The ratio of males to females is 1065 to 1000, the ratio being a slightly increasing one. The total number of deaths for the year was 22,903, being a death-rate of 10·6 per 1000. In this connexion the report adds: "While its urban populations have notably increased during the decade, it has been in only a few instances that this growth has been too fast for the ability of municipal authority to deal with the sanitary problems developed by their new conditions." The increase of deaths has been great in the class "developmental diseases," then following those classed as "local diseases;" whilst the classes zymotic and constitutional show a decrease. Amongst individual diseases the decrease in the cities is marked in diphtheria, being from 0·87 per 1000 in 1892 to 0·60 in 1893. I notice that the rate, too, in influenza has fallen from 0·50 in 1892 to 0·30 per 1000 in 1893, whilst phthisis shows the same rate—1·8 per 1000.

THE SERVICES.

ARMY MEDICAL STAFF.

SURGEON-CAPTAIN MICHAEL THOMAS YARR, F.R.C.S., is seconded for service under the Siamese Government.

INDIA AND THE INDIAN MEDICAL SERVICES.

The Queen has approved of the following promotions among the officers of the Staff Corps and Indian Medical Service made by the Government of India:—*Bengal Medical Establishment*: To be Surgeon-Major-General: Surgeon-Colonel Robert Harvey, M.D., D.S.O. Surgeon-Majors to be Surgeon-Lieutenant-Colonels: George Speirs Alexander Ranking, M.D.; Robert Davidson Murray; Dennis Wood Deane Comins; Patrick Fenelon O'Connor; James Moran, M.D.; William Allason Simmonds; Roderick Macrae; Thomas Elwood Lindesay Bate; Shibram Borah. To be Surgeon-Major: Surgeon-Captain Granville Jameson. *Madras Medical Establishment*: To be Surgeon-Major-General: Surgeon-Colonel Charles Edwin McVittie. Her Majesty has also approved of the retirement from the service of Surgeon-Colonel Jesse Griggs Pilcher, Bengal Medical Establishment. The services of Surgeon-Captain H. E. Drake-Brockman, F.R.C.S. (Bengal), are replaced at the disposal of the Government of the North-West Provinces and Oudh. The services of Surgeon-Captain H. B. Melville are placed at the disposal of the Government of India in the Home Department. Surgeon-Captain H. W. Elphick, Officiating Civil Surgeon, is appointed to be Civil Surgeon, 2nd class, with grade station Sharampur, vice Surgeon-Major P. J. Freyer, promoted, and to continue to officiate as Superintendent, Central Prison, Allahabad.

NAVAL MEDICAL SERVICE.

Fleet-Surgeon Henry Charles Woods, M.D., has been promoted to the rank of Deputy Inspector-General of Hospitals and Fleets in Her Majesty's Fleet.

Surgeon R. T. Gilmour is appointed to the *Tamar*.

ARMY MEDICAL RESERVE OF OFFICERS.

Surgeon-Major Henry F. Holland, M.D., to be Surgeon-Lieutenant-Colonel.

VOLUNTEER CORPS.

Rifle: 1st Volunteer Battalion the Royal Sussex Regiment: Charles John Jacob-Hood, Gent., to be Surgeon-Lieutenant. 2nd Volunteer Battalion the Oxfordshire Light Infantry: Charles Dorrington Batt, M.B., to be Surgeon-Lieutenant. 1st (Inverness-shire Highland) Volunteer Battalion the Queen's Own Cameron Highlanders: Surgeon-Lieutenant A. C. Miller, M.D., to be Surgeon-Captain.

ENTRANCE EXAMINATIONS TO THE ARMY.

We are living in very stirring times as regards the organization and administration of the army. The retirement of the Duke of Cambridge from the post of Commander-in-chief, which he has held for nearly forty years, and the introduction of a new *régime* mainly based on the recommendations of the Hartington Commission are, it is needless to say, measures of a very radical and important character which will probably more or less affect all branches of the service. Among the minor reforms in contemplation are the changes about to take place in the entry examinations for the Royal Military Academy, Woolwich, and the Royal Military College, Sandhurst. The regulations for the medical examination of candidates are understood to be undergoing complete revision and will affect the programme of examination. The War Minister has promised that due and sufficient notice shall be given of these. As regards the character of the literary and scientific examination of candidates the changes will mainly affect the entrance examination for Woolwich. Latin is to be voluntary, chemistry and heat obligatory subjects, and higher mathematics will be divided into two branches and include the calculus, while the number of marks given for colloquial knowledge of French and German will be increased. As regards the examination for Sandhurst, the only change proposed is to increase the number of marks given for a colloquial knowledge of modern languages. These changes will not be regarded in a favourable light by the headmasters of our public schools, but we nevertheless think they are wise. We hold that a course of study and an examination should be adjusted to the end in view. Classics have hitherto usurped such an exclusive and dominating position in this country that they are to some men like counters placed before the eyes, blotting out everything else from view. A good physique, integrity of the sense organs, and perfect health are the necessary physical qualities for a soldier, and a knowledge of mathematics, modern languages, and modern science is nowadays an essential qualification for an officer. The knowledge of Greek and Latin acquired at school by a candidate for the army is, after all, not very considerable. To obtain a grasp of them is hard, and to hold on to them is still harder. An acquaintance with French and German is essential to officers in the present day, and the requirements and pleasures of daily life and Continental travel afford inducements and opportunities for keeping them up. Military education has greatly developed and is still developing, and for the two scientific corps of the service specially trained at Woolwich a sound education in physical science is absolutely necessary to the proper fulfilment of the officers' military duties. A training in these subjects develops the powers of observation and those of the understanding alike. We think that probably just as many boys intended for Woolwich will go to public schools for their education as hitherto and learn Latin there; however, they will not devote the same amount of time to its acquisition, but more to modern languages and science.

THE FRENCH EXPEDITION TO MADAGASCAR.

It looks very much as if the French military expedition to Madagascar would suffer far more from the diseases incidental to a campaign in that country than from the military obstacles and opposition they will encounter there. The sanitary condition of the French troops at Tamatave is described as very unsatisfactory. Out of some 800 men composing the garrison not more than 200 are in good health, according to a special correspondent of the *Standard*. More than twenty soldiers had died from fever in the four weeks ending May 17th, when the mail left. The number of men falling out during the marches of the French troops is large, and the daily increase of sick in the force has subjected the hospital service to a great strain. At Majunga the field hospitals and ambulances are said to be crowded. A troop transport service has been organised for the regular conveyance of the sick from Madagascar to France. It is understood that General Ducloux has sent a dispatch to the French War Minister in which, although he

states the military situation is good, he has demanded many additions to the expeditionary force in the way of administrative officers, nurses, sappers, and workmen, with the view of facilitating the transport of provisions and war material.

CHANGES AT THE WAR OFFICE.

Notwithstanding the apparently general desire that Mr. Chamberlain should be the new Minister for War in the Salisbury Government it seems that his predilections in favour of the Colonies have prevailed, and Mr. Chamberlain has been nominated as Secretary for the Colonies. This appointment will give him an opportunity for developing his policy in regard to our Colonial possessions and probably afford him sufficient leisure for taking an active part in the debates of the House of Commons. Sir Arthur Halliburton, K.C.B., has been appointed Permanent Under Secretary for War in succession to Sir Ralph Thompson, whose departure from the War Office will be unanimously regretted. Sir Ralph Thompson rendered a most important service to the Army Medical Department as a member of a committee at the time the late Sir William Muir was Director-General in helping to obtain for that service the Royal Warrant of that date. Mr. George Lawson, C.B., becomes Assistant Under Secretary in place of Sir Arthur Halliburton. Sir Ralph Knox will be Assistant Financial Secretary as well as Accountant-General.

THE CHITRAL EXPEDITION.

Surgeon-Colonel T. Maunsell, the principal medical officer of the Chitral force, had, according to the latest accounts, proceeded to Chitral. The troops continue to be healthy and to be free from any epidemic disease, but there has been an increase of sickness in General Low's force, owing probably to the great heat in the Swat and Panjkora and Bajour Valleys. According to the *Pioneer Mail*, Surgeon-Captain Whitchurch arrived at Gilgit from Chitral on May 28th in charge of Captain Colin Campbell and a convoy of sick and wounded. He left Chitral with twenty-four sick and sixty convalescents, but on arrival at Gilgit had only four sick, the remainder being convalescent. The wounded, with two exceptions, who are fast recovering, are quite well. Captain Campbell's knee has quite healed, all inflammatory symptoms have subsided, there is but very little deformity and a good amount of movement, and he is able to walk and ride.

SURGEON LEA, R.N.

The *Broad Arrow* states, with reference to "the extraordinary circumstances attending the court-martial held at Sydney for the trial of Surgeon Lea, R.N.," who was charged with insubordination towards the captain of the *Ringarooma*, and was dismissed from the service, "the case is clearly one that necessitates most careful inquiry by the law officers of the Admiralty, and it is probable that the public will hear more of Surgeon Lea. Mr. Henniker-Heaton, M.P., asked a question on the subject on Tuesday, and was assured that the minutes of the trial were being examined at Whitehall. A report is gaining ground at the naval ports that there has been a failure of justice in this peculiar case; but we repeat that it is necessary to suspend judgment for the present. The minutes of the trial only reached the Admiralty on Tuesday last, and on that ground Mr. Henniker-Heaton consented to postpone his question."

INDIAN MEDICAL SERVICE.

An examination for sixteen appointments to Her Majesty's Indian Medical Service will be held in London on Aug. 2nd, 1895, and following days. Copies of the regulations for the examination, with information regarding the pay and retiring allowances, &c., of Indian medical officers, may be obtained from the Military Secretary, India Office, London, S.W., to whom the necessary certificates must be sent so as to reach him not later than July 19th next.

THE INSTRUCTION OF OFFICERS OF THE AMERICAN ARMY IN HYGIENE AND FIRST AID TO WOUNDED.

The annual report of the Board of Visitors to the United States Military Academy at West Point contains, according to the *Army and Navy Gazette*, a recommendation for the establishment of a chair of anatomy, physiology, and hygiene, and first aid to injured, at West Point, to be filled by a senior surgeon, who is to deliver a course of lectures and demonstrations on these subjects.

Correspondence.

"Audi alteram partem."

"THE MIDWIVES REGISTRATION BILL."

To the Editors of THE LANCET.

SIRS,—Though the political events of the past few days have made it highly improbable that anything more will be heard of the Midwives Bill during the present Parliamentary session, I trust you will allow me to reply to the important letter in THE LANCET of last week from the Master of the Rotunda Hospital. Dr. Smyly is in favour of the main objects that the promoters of the Bill had in view—namely, the proper training and registration of midwives,—so that his objections are those not of an opponent, but of a friendly critic. He first of all finds fault with the words "without the direct supervision of a medical practitioner." Midwives in this country, however, do attend cases without direct supervision. The aim of legislation is not to make such attendance illegal, but (1) to restrict it to cases of natural labour, and (2) to ensure that the midwife is competent—i.e., that she is capable of managing a case of natural labour, and (what is of equal importance) of recognising complications and abnormal conditions so as to know when a medical man should be sent for. The more highly a midwife is trained, the more ready will she be, in my opinion, to seek assistance in case of difficulty. Dr. Smyly is surely mistaken when he says that many midwives depart on the arrival of the medical practitioner. I, at least, have never heard of such an occurrence. It is the aim of the supporters of the Bill to promote coöperation and not antagonism between the midwife and the medical practitioner. There seems to me no reason to fear that it would fail to have the intended effect. At the same time, any alteration in phraseology that can be shown to tend to more harmonious working would be readily accepted.

Dr. Smyly's second objection is that the Bill does not sufficiently provide against midwives undertaking cases other than normal. In the Bill, "as amended on report" and reprinted on June 20th, any doubt upon this point is set at rest by the following paragraph (Section 5 of Clause 12, referring to removal of name from register): "For the purposes of this section professional misconduct shall, in addition to any other form of misconduct, include any omission to send for a medical practitioner where the case is not one of natural labour." The third objection is the centralisation of all authority in London. In the scheme upon which the Bill was based it was suggested that the carrying out of the provisions of the Bill should be entrusted to local midwives boards established in every centre where it is decided to conduct examinations; that these local boards should consist of the examiners; and that the central board should consist principally of members of the various local boards. It would have loaded the Bill with detail to have included in it all these suggestions, but there is nothing in it to prevent their ultimate adoption or, at any rate, to prevent the adoption of the principle of decentralisation on which they were founded and of which the supporters of the Bill are strongly in favour. The last objection is that the provisions of the Bill do not extend to Ireland. The promoters were certainly not aware that Ireland desired to be included. They will put no difficulty in the way if the Irish really desire to be brought within the scope of the measure. I trust Dr. Smyly will see that his objections are not of an insurmountable kind, and that they are scarcely such as to render necessary his opposition to the Bill as a whole. Some of them are due to misapprehension, and the rest can be most suitably dealt with by friendly conference.

I am, Sirs, yours truly,

CHAS. J. CULLINGWORTH.

Brook-street, W., June 26th, 1895.

To the Editors of THE LANCET.

SIRS,—In your issue of the present date you publish a letter from Dr. Smyly, Master of the Rotunda, which indicates that he has fallen into some errors in respect to the Bill. He regards the definition of the term "midwife" as given therein as indicating the intentions of the Midwives Institute to obtain for midwives entire freedom from supervision by medical men. As a matter of fact, the definition

was drawn up at the first meeting of the Provisional Committee which preceded and led up to the formation of the Midwives Registration Association, and it was adopted at the first general meeting of the association, on July 3rd, 1893, as a part of its working basis. No midwife had any hand in it. Dr. Smyly, as a member of the Midwives Registration Association, should be aware of these facts. The definition *was* and *is* intended to define the present status of a midwife, the object of the Bill being to place midwives under the formal control they so greatly require, not to free them from that which, indeed, does not exist. In the Bill "as amended on report" the definition has been omitted. Dr. Smyly's objection that the Bill does not sufficiently provide against midwives treating cases which are not normal, is due to a misreading of the Bill. In the amended measure a special clause prevents any further misconception on this matter, as it specially makes it a form of professional misconduct to omit to send for a medical practitioner in abnormal cases. He complains that the authority under the Bill is centralised in London, but this town is only mentioned once in the Bill, in connexion with the Royal College of Physicians of London, and it was certainly not intended to centralise all authority in that town, as it would make the Bill unworkable. If he will refer to his copy of the "Suggested Scheme" of the Midwives Registration Association he will see that provincial rights were then carefully considered, but it is, of course, impossible to put any but general expressions and powers in a Bill of this nature. The wording of the clause which names the authorities who nominate the members of the central board was suggested by the President of the General Medical Council. As to Rotunda midwives being prevented from practising in England and Wales, Dr. Smyly is wrong in two respects: any woman can practise in either country after the passing of the Bill just as she can now; and while it is especially provided that the conducting of the examinations should be in the hands of the central board, so that a minimum standard should be made obligatory, it is evident that Irish or any other midwives who had passed a higher standard than that required by the board would be admitted to the Register. At the worst it would but be for the midwives who had been trained in Ireland to pass their examination in England, as is so often done by medical students. Perhaps Dr. Smyly would kindly state exactly the amendments he would like to see in the Bill (and give a definition of "midwife"), and I will take care that they come forward for discussion and will guarantee a fair and full hearing.

I am, Sirs, yours faithfully,

F. ROWLAND HUMPHREYS.

Fellows-road, N.W., June 22nd, 1895.

To the Editors of THE LANCET.

SIRS,—The article by Dr. Boxall and Mr. Humphreys' letter will, I think, afford some food for reflection. There can be little doubt of the truth of the conclusions drawn by Dr. Boxall as to the nature of the disease from which his patients suffered, but I wish to refer to the fact that it is very much more difficult to arrive at correct conclusions in private practice, where all the conditions are not so much under the control of the medical man as they are in hospital. It has, on more than one occasion in my own practice, been a matter of extreme difficulty to worry out the facts necessary to be obtained before coming to any conclusion, and it seems to me to be unsound policy to encourage uneducated practice when the difficulties to be overcome are quite great enough already. Look at the difficulties in the path of the medical man summoned by a midwife to such cases as described by Dr. Boxall, and probably not until there was mischief in the region of the puerperium, and consider how much injustice might be done to the midwife and perhaps, also, to the patient. Mr. Humphreys' letter also goes to show that this insane legislation has been forced upon the country by those who have never even taken the pains to arrive at the facts connected with the question. I will just state the fact that the guardians have nothing whatever to do with providing nursing assistance to the out-door poor; they can admit a parturient woman to the infirmary for her confinement, and they can give an order for medical attention in case there is any difficulty connected with delivery occurring in people outside the infirmary. The relieving officer, however, can require the person to whom the order is given to pay, by weekly instalments, either the whole or a portion of

the fee for attendance if he knows that there is sufficient money coming into the family to justify his action. Mr. Humphreys, too, shows his ignorance, not only of the work done by the district and county councils, but also of the way in which they do it. The proposal I have made does not imply the wholesale pauperisation of the districts reported upon. Payment would be made in proper cases commensurate with the money earned by the family. With some experience I can assert that it is not the Poor-law which is pauperising the country, but it is the abuse of the hospital system and wholesale indiscriminate dole-giving. The reason the Poor-law is unpopular is because it is the duty of the relieving officer to ascertain the position of the people to whom relief, either medical or other, is given; and, given a good relieving officer, and many such are to be found throughout the country, with good local knowledge, the system works excellently well. It is a fact that no Continental country has a system of relief in any way comparable to our own for efficiency.

I am, Sirs, yours obediently,

Hatfield, Herts, June 23rd, 1895. LOVELL DRAGE, M.D. Oxon.

To the Editors of THE LANCET.

SIRS,—At the annual meeting of the Lancashire and Cheshire Branch of the British Medical Association, held in Liverpool on the 19th inst., a member asked "for information regarding the 'protest' forwarded to the General Medical Council by certain persons assuming to represent a number of the members of this branch." The "protest" was sent in on the occasion of the committee of the branch petitioning and sending a deputation to the General Medical Council in May last. Information was requested under three headings: 1. Whether authority had been obtained to use the signatures appended to a "protest" in June, 1894, and in which it is stated, "As there is no Bill at present in existence, a fact which was again and again impressed upon witnesses by the select committee, it is impossible to tell what statutory penalties may be provided for cases in which the limits of practice shall have been exceeded," in order to promote the present Midwives Bill by damaging the effect or weight of the petition and deputation of the branch. 2. The signature of a member of the General Medical Council was appended to a document forwarded to that body in order to influence its action. The signatures of two of the members of the deputation against registration to the General Medical Council were appended to the document, thus making these gentlemen protest against their own action. 3. The person forwarding the "protest" says in his letter to the General Medical Council, "the deputation would not represent the branch officially." The statement had also been made that the petition was not an official one, and that the committee does not represent the branch.

Dr. James Barr hereupon explained to the meeting that the petition of, and deputation from, the branch were "official" and represented the branch, and quoted from his minutes of March 9th and May 11th, 1894, in support of his statement. One of the members of the deputation alluded to now rose and formally complained that his name had been placed on this list of "protestators" without his knowledge or consent. Dr. W. Macfie Campbell then stated in explanation of Question No. 1: "That the signatures had been obtained by means of reply postcards twelve months ago, and that he had not deemed it necessary to again circularise the members on the subject." "In reply to Question No. 2, all he had to say was that if Dr. Leech chose to sign the protest it was his own affair, and that he (Dr. Macfie Campbell) was not going to prevent him." But Dr. Macfie Campbell had not even a lame explanation to offer the meeting as to how the name of a member of the deputation came to figure on his "protest list."

I am, Sirs, yours faithfully,

H. HORBURY PRESTON.

Assistant Hon. Sec., Lancashire and Cheshire Branch Committee of British Medical Association.

Pendleton, June 22nd, 1895.

THE MISUSE OF HOSPITALS.

To the Editors of THE LANCET.

SIRS,—One would fain believe that the numerous preachers whose pulpit utterances on Hospital Sunday were to the

effect that nearly half of the people of London sought (and obtained) medical and surgical aid at some one or other of the metropolitan hospitals and dispensaries in a single year had made a considerable call upon their imaginations; but there was a remarkable unanimity amongst them, and the higher critics would have no difficulty in tracing their accounts to a single source—namely, *The Hospital Sunday Supplement*. To this are appended tables for 1894 which, although St. Bartholomew's and St. Thomas's Hospitals and one or two other places are excluded, make it appear that 1,383,634 distinct patients were treated in that year at those institutions whose names are given. In the earlier part of the document, which refers to 1893, special mention is made that one out of every two men was treated thus in London, but in this case the endowed hospitals are included. And we are to believe this, knowing all the time that the pauper population is otherwise provided for, that our soldiers and policemen have their own staffs of medical men &c., and that many other bodies are similarly situated. These rarely figure in our hospital returns. Of course, one cause (easy to detect) of the apparent exaggeration is the author's restriction to London of the population from which the patients are drawn. But the great majority come from this restricted area, and the only other explanation at all feasible is that in many instances the daily returns of out-patients were added together for the year.

There is no doubt, however, that throughout England there has been a growing tendency on the part of the population to betake itself to hospitals in case of sickness or injury. There is an instructive passage in the Registrar-General's Census Report for 1891, vol. iv., p. 77: "The patients enumerated in hospitals were 7619 in 1851, 10,414 in 1861, 19,585 in 1871, 24,087 in 1881, and 27,579 in 1891. The proportion of these patients to 100,000 of the population was 42 in 1851, 52 in 1861, 86 in 1871, 93 in 1881, and finally 95 in 1891. It must not be supposed that this continuous increase implies a corresponding increase of sickness. The proportion of hospital patients to population is a measure rather of the amount of hospital accommodation than of the amount of sickness." In fact, hospital accommodation is at present (and will be for some time to come) quite equal to the needs of those who are the proper recipients of it. But its recent enormous extension has had a pauperising effect upon the community, and in these days many obtain aid at hospitals who ought to be heartily ashamed of so doing.

I am, Sirs, yours faithfully,

Kingston-on-Thames, June 26th, 1895.

D. BIDDLE.

* * Mr. Biddle refers to the supplement issued by a contemporary. *THE LANCET* Hospital Sunday Fund Supplement (June 8th, 1895) shows in a statistical table of the hospital work in London during the year 1894 that 1,565,978 out-patients paid visits to twenty-seven "general hospitals" (using the term as employed by the Council of the Metropolitan Hospital Sunday Fund). A further number of visits—118,470—to cover possible omissions were estimated to have taken place, making in all 1,684,448. It is distinctly stated in a note to this table, with a view to obviating a source of serious error, that "the figures referring to out-patients in these tables represent the number of VISITS paid by out-patients—not the NUMBER of out-patients."—ED. L.

THE "INDEX MEDICUS."

To the Editors of *THE LANCET*.

SIRS.—Mr. George S. Davis, the enterprising enthusiast who, since January, 1885, has at very heavy loss maintained that most valuable aid to all working medical men, the "Index Medicus," announces that he does not see his way any longer to continue losing 2000 dollars a year for the sake of the profession. It will be remembered by many that in 1893 Mr. Davies intimated that unless more subscriptions came in he would be obliged to discontinue the publication; and it was hoped that the many members of the profession in this country who have obtained invaluable help from the Index would have felt it their duty as well as their interest to have subscribed liberally enough to have enabled Mr. Davis to persevere with his great public service. This hope has not been realised. The Index has become absolutely indispensable, and the loss of it means that in reference-hunting we shall

have to remember twenty or thirty different sources of information and search through all of them, instead of, as hitherto, finding everything in the clearly printed pages of the monthly Index.

I have written to Dr. Billings, whose marvellous power for organising Index work is well known, urging him to take steps to have the Index carried on on a non-commercial footing, and to endeavour to obtain subscriptions from scientific societies and scientific workers for its maintenance; and I should be glad to know what measure of support might be expected in this country for such a scheme. If £400 a year could be guaranteed from this country the Index could be continued; and I think it will be a shame to English medicine, which has derived so much benefit for the last fifteen years from this great American enterprise, if such a small sum should not be forthcoming. Every medical society should regard it as a duty to subscribe at least two guineas to maintain the Index, and the rest should be easily made up by the subscriptions of medical men who would be glad to have this important aid at their elbow. I should be grateful to hear from those willing to support the Index by an annual subscription, and will forward their offers to Dr. Billings, who, I feel sure, will not allow the Index to be lost without a struggle.—I am, Sirs, very faithfully yours,

J. Y. W. MACALISTER,

Resident Librarian of the Royal Medical and Chirurgical Society, Hanover-square, W., June 25th, 1895.

"DEFECTS OF VISION AND ACCIDENTS."

To the Editors of *THE LANCET*.

SIRS.—The able letter of your Indian correspondent, Mr. J. Stuart Brooke, is interesting and timely, and it is to be hoped will receive the attention here it merits. The detection of the man with the artificial eye on board of the *Canarder* in the early seventies led to the examination of all men detailed for look-out duty with reference to short sight, colour and night blindness; and I know that to-day, in the same service across the Atlantic, this testing is still continued with the addition of taking notice of the competency of hearing, a keen sense of which is most important in fog. There is no railroad track across the ocean, hence the more need that these floating villages should have sentinels wide-awake and effective. It may seem somewhat a large order to say that the only uniform and practical remedy for the prevention of these disasters at sea consists in the appointment under the President of the Board of Trade of a principal medical adviser. This official, who should be a man of practical knowledge and of administrative ability, would relieve the President of all technical work and guarantee to the public that, so far as he was concerned, efficiency was the rule of the road afloat as well as ashore. Nor would his office end here. He would be the recipient of the medical logs of the different steamers. Here facts could be sifted and tabulated, to the utilisation of the field of marine hygiene that has long lain waste; and, *per contra*, the fads and fancies of enthusiasts with regard to medical matters at sea, remedies, and what not would receive their just estimate and be utilised for what they were worth. Some of your readers will recognise the necessity of these remarks. Sirs, it is needless to trouble your space further than to say simply that the public and the profession look to you that the suggestions of the expert deputations of Feb. 1st last will not pass away without some practical results.

I am, Sirs, yours faithfully,

Sussex-place, Southampton, June 24th, 1895. R. A. CALDWELL.

"RAPID DILATATION OF THE UTERUS."

To the Editors of *THE LANCET*.

SIRS.—In his Note on Some Aids to Rapid Dilatation of the Uterus Dr. Amand Routh recommends, in certain cases, the preliminary use of a glycerine tampon. It may be interesting to some of your readers to hear that during the last two years I have found the use of a glycerine tampon very serviceable in midwifery practice when the pains are inefficient, the vagina "dry," or the cervix "rigid." It seems to me that such a tampon is needed in cases in which it has been thought necessary to use an astringent antiseptic before delivery, and it is much more convenient than iodoform.

Two ounces of glycerine containing one drachm of borax and one drachm of boracic acid are easily carried, with sufficient perchloride wool to make a few tampons; and I believe it is worth its place in any midwifery bag. It usually acts in half an hour or less.

I am, Sirs, yours truly,

Conisborough, June 22nd, 1895.

ROBERT CRAIK.

"EPSOM COLLEGE."

To the Editors of THE LANCET.

SIRS,—May I, as an old Epsomian, be allowed to protest against the frequency of the appearance in your columns of the title "Royal Medical Benevolent College" with reference to the above public school? A few weeks ago in a leading article in the *Standard* it appeared that "the Royal Medical Benevolent College was not one of the best-known public schools," and the writer goes on to suggest that this may partly be accounted for by the use of the above-named title. It altogether deceives the general public with regard to the main object of the College—that of giving a good general education to all irrespectively of class distinctions. That it does refer to the system whereby a bare 20 per cent. of the scholars receive a free education no one will venture to deny, but that it should have the power to conceal from the public the fact that 80 per cent. of the scholars are treated and educated identically as at any other public school seems a pity—not to say a mistake. Further, I believe that the title no longer *legally* exists. A little more than a year ago the title (which for the school in its early days was well suited, but for which in its present circumstances it is entirely unfit) was annulled by Act of Parliament. It is, in fact, the old cry, *Tempora mutantur, nos et mutamur in illis*.

Amongst the other public schools we have ranked as Epsom College for many years, and it is this title which will always appeal most lovingly to her sons, both past and present, and whose honour it will be their care to uphold. Some twenty years ago an old boy of distinction, in a long letter to the school magazine, pointed out the harm that was likely to arise from the retention of the old misleading title, and urged the then present members to do their utmost to secure the sole recognition of the other title, "Epsom College." As far as the school itself is concerned their efforts have been crowned with success, but unless we are able to enlist THE LANCET on our side (and after that the daily papers are bound to follow) that success, we fear, must to a great extent be stultified. It is with no desire to belittle or decry the charitable work which the school so magnificently performs that this letter has been written, but rather that it may be further aided in its work by being known in its true colours. There is a strong feeling in the school on this point, and therefore I trust that this letter may not be considered as encroaching too much upon your available space.

I am, Sirs, yours faithfully,

O. E.

June 25th, 1895.

* * The council of the Royal Medical Benevolent College at Epsom are, we know, more than willing to omit the word "benevolent" from the title of the College; but as long as they are compelled to solicit subscriptions and donations to carry on the benevolent side of their work, so long must the epithet remain. The points our correspondent raises are all well appreciated by the governing body, and they have obtained powers under their new Act to alter the name *when they are in a position to do so*; but at present the correct designation of "Epsom College" is the one to which our correspondent takes exception. We, like the council of the College, are sincerely desirous of seeing the necessity for the epithet removed and jealous for the position of the school as one of the great schools of England, so that we are happy to print our correspondent's views.—ED. L.

MANCHESTER.

(FROM OUR OWN CORRESPONDENT.)

The Extension of the Royal Infirmary.

THIS question is still under discussion. In March last a special or grand committee was formed composed of an equal

number of members of the board and of trustees who were not members. Several meetings have been held, and the last, at which there was a full attendance, occurred on the 17th inst. A long discussion took place on the proposals for rebuilding on the present site, for altering and enlarging the present building, and for the erection of a new hospital in the suburbs. As to adapting the present building, it was pointed out that considerable space is devoted to the nurses, who, about 100 in number, live and sleep on the premises. It was urged that if they were accommodated outside, this space would be gained and it would be better for the nurses. Another suggestion was that the washing might be done outside and the space now occupied by the laundry be utilised for patients. It was also recommended that the out-patient department should be removed to premises to be taken for the purpose near at hand. All these suggestions have been before the board at various times since 1890. They were received with some favour, but doubts were expressed as to whether they would, if carried out, meet the requirements of the case. In the end, on the motion of Sir W. Houldsworth, M.P., a subcommittee was appointed to take these proposals and all the other schemes for achieving the object in view into consideration and report to the general committee. It is said that the subcommittee "will thrash out all the details, and it is hoped that when they present their report the general committee may be able to come to a unanimous decision." The difficulty is to increase the accommodation of the infirmary without further encroachment on the open space in which it stands, but it can no doubt be done if the present building is pulled down—which is the best thing to do—and the nurses, the out-patient department, and the laundry are taken outside the infirmary grounds. It would be a great pity to patch up and attempt to modernise the present building, and would only lead to disappointment.

Death of Professor W. C. Williamson, M.B.C.S., LL.D., F.R.S.

Professor Williamson's death, which took place recently at Clapham Common, will be regretted by many here as well as by a large circle of scientific friends. Though his association with Manchester was much broken when he gave up active work at Owens College in 1892—receiving on his retirement the title of Emeritus Professor of Botany—he may be claimed as one of those who by their scientific eminence have shed lustre on this city of manufacturers. His father had for many years been greatly interested in zoology, botany, and geology, and in 1838, when young Williamson was about two-and-twenty, became curator of the Scarborough Museum. In his own home, therefore, as it has been said, he "breathed an atmosphere of scientific research." He was apprenticed to a medical man in his native town and began the study of medicine, but kept up his geological pursuits, as shown by three early memoirs on "The Vertical Distribution of the Organic Remains of the Yorkshire Coast." In 1835 he became the curator of the Manchester Natural History Museum, but must have continued his medical work, since his qualifications of M.R.C.S. Eng. and L.S.A. date from 1840. He was long known in Manchester as a general practitioner, though never giving up his scientific pursuits, and devoted special attention to diseases of the ear, which he had studied on the Continent. The Manchester Ear Institution owes its origin to his energy and enthusiasm, and for ten years he was an active member of the staff. On the foundation of Owens College Mr. Williamson was appointed its first Professor of Biology and Geology. Such a field of work was too much for any one man to cover, and first the teaching of geology, and then of zoology, fell into other hands, the former being now taught by Professor Boyd Dawkins and the latter by Professor Hickson, Mr. Williamson retaining the chair of Botany. Papers on the Scales and Bones of Fossil Fishes led to his election as a Fellow of the Royal Society, and a series of memoirs on the Carboniferous Plants of Lancashire and Yorkshire gained him the Royal Medal of the Society, whilst the Wollaston Gold Medal was awarded him by the Geological Society in 1890. He was specially skilled in the patient grinding of coal sections, so as to become beautifully transparent and instructive objects for the microscope. The University of Edinburgh conferred on him the degree of LL.D., and he was an honorary member of the Swedish Academy of Science, as well as of those of Göttingen and Geneva. He took an active interest in the Manchester Literary and Philosophical Society, and was President for the year 1884-5. After retiring to Clapham he began a new series of memoirs for the Royal Society in

conjunction with Dr. Scott, and continued his investigations in his favourite subject—the plants of the carboniferous strata. He was an ardent and enthusiastic student of science through his life of seventy-eight years, but his active mind was interested in many subjects—literary, archaeological, and social; and it may be added that among his lighter pursuits he was a skilful and successful horticulturist.

Suicidal Poisoning by Carbolic Acid.

On Tuesday, the 18th inst., Mr. Sidney Smelt, the deputy coroner, held an inquest on the body of a man forty-six years of age, who was found dead in bed. It was evident that he had taken carbolic acid from a glass which was on the dressing-table, and which still contained a little of the acid. The deceased had been much troubled about some trust money, and had probably contemplated suicide for some time, for "when he heard of people committing suicide he had a way of saying that they were better off." The verdict was "Suicide while insane." Some people consider suicide a proof of insanity, but whatever view is taken of the mental condition, the fact is that this man, who contemplated suicide, had no difficulty in obtaining the poison. The *Manchester Courier* says: "It is noteworthy that during the last fortnight the deputy city coroner has held inquests on seven persons who had died from taking carbolic acid, and that there have been about twenty such suicides in the city during the present year." In the same paper for the 20th inst. is the report of a suicide in Warrington, where the druggist "deposed to deceased purchasing three pennyworth of carbolic acid for disinfecting purposes." These instances show how easily and cheaply a deadly irritant poison, one of the chief favourites with the suicidal, can be obtained by anyone. In one of the evening papers for the 21st inst. there is an additional inquest reported, with the heading "Supposed Suicide of a Young Woman—Carbolic Acid Again," where the cause of death was certified by the police surgeon as due to this poison. Another suicide (of a Manchester merchant) from the same poison took place recently in Sale, a residential suburb of Manchester, though just on the Cheshire side of the Mersey. It is surely desirable to place some restrictions on the sale of this poison, more frequently used for suicide than perhaps any other, presumably from its cheapness and the ease with which it is obtained. No doubt what is so common an occurrence in this district takes place frequently in most parts of the country, and if the figures could be obtained the total would be startling.

NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

The Tyneside Carnival.

THE rival attractions of the races and the Temperance Festival are this week in full operation in Newcastle-upon-Tyne. Formerly the races were held on the Town Moor, and were for many years looked forward to in the north of England as the holiday of the year. The pitmen came in thousands, with their wives and children, and enjoyed a picnic on the Moor the day the Plate (the Pitmen's Derby) was run for. The Moor was free to all, and the scene upon it during race week was thoroughly representative of North-country popular enjoyment. Now the races are held at Gosforth Park and the character of the gathering is altogether altered. It is racing pure and simple; the sporting publican element predominates, gate money is exacted, and the family holiday element of the humbler classes is altogether absent. The Moor now during race week is occupied by perhaps quite as many people as formerly, bent on pleasures of a character supposed to be less harmful than horse racing—military sports, foot races, kite-flying, shows (not always above suspicion), Aunt Sally, dancing in saloons, &c. Whatever view may be entertained as to the comparative merits of the amusements provided now by the Temperance Festival, and formerly by the races, every Newcastle man must rejoice that within easy access of the centre of the town there is such a splendid open space for the recreation of the people as the 1200 acres of moor afford.

The Milk-supply of Newcastle-upon-Tyne.

Dr. H. Armstrong, the medical officer of health for the city and county of Newcastle-upon-Tyne, has just issued a special

report on the milk-supply of the city. Dr. Armstrong suggests that every cow proved or reasonably suspected to be suffering from tuberculosis on a dairy farm should be slaughtered, that all milk capable of spreading any infectious disease should be destroyed, and that sanitary authorities should have the power of controlling the sale of milk in their districts and to license sellers. The report, like all Dr. Armstrong's reports, is an exhaustive and valuable one.

Durham University.

At a Convocation of Durham University held on Tuesday, June 25th, the Sub-Warden (Rev. Dr. Pearce) presided, and announced that the new charter had been received, by which power is given to confer degrees on women in all faculties except divinity. The following degrees were conferred:—Hon. D.C.L., Sir John Stainer, Prebendary William Rogers (*in absentia*); Hon. D. Litt, John Bagnale Bary, Ingram Bywater, William John Courthope, Frank Byron Jevons, Frederick Geo. Kenyon; Hon. M.A., James Francis Hodgson. Then followed a large number of ordinary degrees, among them that of B.Sc., conferred on Miss Ella Mary Bryant, Durham College of Science, Newcastle-upon-Tyne.

Newcastle-upon-Tyne, June 26th.

SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

Glasgow Royal Infirmary.

DR. J. LINDSAY STEVEN and Dr. J. H. Pringle have been appointed physician and surgeon respectively to the infirmary. Dr. Steven's appointment renders vacant the position of pathologist to the hospital and curator of the museum.

Ashgrove Home for City Children.

This is a new institution, which is to be worked in connexion with the movement for giving to the children of the poor a summer holiday in the fresh air. This movement was inaugurated in 1885, and has now reached very wide limits, no less than 7000 children being sent out of Glasgow last year for a fortnight's residence at the coast or in the country. The children to be eligible for such a treat must be between the ages of five and fourteen, and careful inquiry is made into the circumstances of the parents in order to prevent the charity being abused. The new home is to be more especially used for the reception of weakly and delicate children, and the appointment of Dr. Alice L. Cumming as matron of the home will therefore be recognised as a peculiarly appropriate one. The building has been hitherto a private residence and has been adapted to its present purpose with comparatively little alteration. It stands in its own grounds, which extend to fully five acres. The home is the gift of two Glasgow ladies who desire that their names shall not be made public.

Inspector of Alkali Works in Scotland.

Mr. R. Forbes Carpenter, F.I.C., has been appointed by the Local Government Board and the Secretary for Scotland as chief inspector. Mr. Carpenter joined the staff in 1882, and has been in charge of the East Lancashire and Yorkshire district.

Aberdeen University.

The Duke of Richmond and Gordon, Chancellor of the University of Aberdeen, has appointed Mr. Alex. M. Gordon of Newton to be his assessor in the University Court in place of the late Mr. Ramsay of Barra and Straloch.—The committee appointed to make arrangements for the opening of the new Students' Union and the inauguration of the Graduation Halls have drawn up a programme of the proposed ceremonies. These are to extend from Tuesday, Oct. 22nd, to Friday, Oct. 25th. According to the programme the celebration will commence on the Tuesday with a grand reception by Dr. Mitchell from 8 to 11 P.M. in Marischal College. On the following day the inauguration of the Mitchell Tower will take place at 11 A.M. by the new clock being allowed to strike for the first time, and Dr. Mitchell will then proceed to the Students' Union and formally hand it over to the students. He will be presented by the Students' Representative Council with an address thanking him for his magnificent gift, and then the ceremony of inaugurating the Graduation Hall will be performed by the Chancellor of the University, the Duke of Richmond and Gordon, who is expected to be present. The present upper

hall will be converted into the picture gallery of the university and will serve as the vestibule to the great Mitchell Hall. The Chancellor, standing in the picture gallery, will declare the Graduation Hall open, and the company of over 300 guests will then pass in to a luncheon given by Dr. Mitchell in the hall. On the following day the festivities will commence at noon by the presentation of the freedom of the city to Dr. Mitchell, and at one o'clock there will be a luncheon given by the Lord Provost. At four o'clock in the afternoon that day Lord Huntly will deliver his rectorial address in the new Graduation Hall, and the day's proceedings will be terminated by a grand torchlight procession in the evening. Friday, the last day of the celebrations, will be marked by the formal acknowledgment by the University of Dr. Mitchell's munificence. A gold medal will be struck and presented together with an address by the University Court to Dr. Mitchell, and medals in silver will probably be given to the principal guests. This presentation will take place at 11 A.M. on Friday and will be followed by the conferring of the honorary degrees of D.D. and LL.D. by the Chancellor of the University. There will be a service in King's College Chapel at three o'clock on the Friday afternoon.—The mason work of the Mitchell Tower was completed yesterday.

The Aberdeen City Fever Hospital: Action against the Town Council.

Some time ago a parent raised an action for damages against the town council for the death of his child in the City Hospital. The father alleged that the death was the result of unnecessary exposure of the child in removal to the hospital. The pursuer lost his case. Dr. Littlejohn, medical officer of health, Edinburgh, and Dr. Watt, senior assistant to the medical officer of health, Glasgow, were called as witnesses for the defence, and it is now reported that in consequence of the public importance of the question raised they asked for no fee for their appearance in court. The Bills and Laws Committee of the town council, however, are to send to each an honorarium of five guineas.

June 25th.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

Local Government Board Inquiry.

AN inquiry was held in Belfast by Mr. Agnew, Local Government Board inspector, on June 19th in reference to the death of a man which took place in the lunatic department of the Belfast workhouse on April 25th. This investigation arose through a communication forwarded to the Local Government Board by the city coroner. It appeared from the evidence that Dr. Barron, a dispensary medical officer, attended the man before his admission for congestion of the brain. It is stated on his certificate that the man was suffering from "apoplexy," but he was admitted to the workhouse. He did not consider he was a lunatic. When the man was brought on a car to the workhouse, on April 23rd, he was examined by two of the resident medical staff, Dr. Beatty and Dr. McLiesh, who came to the conclusion that he was suffering from epilepsy and deterioration of mind, and sent him to the epileptic ward, where he was in charge of Dr. Patrick as resident medical officer, who believed that the man was suffering from epilepsy, slight pleurisy and congestion of one lung, and bronchitis. He had no signs of congestion of the brain, but he did not consider him of sound mind. The real point at issue was whether epileptics could not be treated in a portion of the infirmary without sending them to the lunatic department. The evidence showed that a person with epileptic symptoms would be sent to the epileptic ward even though he was suffering from mental disorder. It is the duty of the resident officers, if they found a patient suffering from epilepsy, to send him to the epileptic ward, whether he is suffering from insanity or not. Mr. McConnell, senior visiting medical officer of the workhouse, in his evidence, said he had come to the conclusion that there was no such thing in the workhouse as patients purely epileptic. There were people of unsound mind in the house, but they did not call them lunatics; only the Local Government Board would call them so. No person was called a lunatic by him until certified to be so, and then he was sent to the asylum. There was only one of the epileptics in the lunatic building now who at all approached insanity. The inquiry has

concluded, but the result will not be known for some time yet.

Belfast Royal Hospital.

The Coulter Exhibition has been awarded to Mr. R. J. Johnston, and the Malcome prizes to Mr. McCully (first) and Mr. McDave (second) at the Belfast Hospital for Sick Children. Mr. Beggs has gained the gold medal.

Bangor (co. Down) Water-supply.

I understand that an arrangement has been made between Lord Dufferin's agent and the Bangor Town Commissioners for supplementing the present water-supply from Clondeboy Lake, and that, as soon as the pipes are laid and the connexion made, the supplementary supply will be turned on.

Dispensary at Ballymoney.

The Ballymoney board of guardians have requested the Local Government Board to sanction the loan of a sum not exceeding £400, to defray the cost of providing a dispensary for Ballymoney Dispensary District.

Death under Chloroform in one of the Cork Hospitals.

A death under chloroform occurred in one of the Cork hospitals on June 19th. The patient had been suffering from empyema for a considerable time, and on two occasions within a fortnight prior to his death large quantities of pus had been removed by aspiration at his own home. Two days after admission to hospital he was put on the table for the purpose of procuring drainage by incision and removal of portion of a rib. The heart was pushed over very considerably to the right side and encroached on the right lung; the face was livid, and the case generally was regarded as a desperate one, in which all risks should be taken. When only partially under the anæsthetic, before a drachm had been administered, the heart ceased to beat and all efforts at resuscitation failed.

The Irish Queen's Colleges and the "65" Rule.

I have already informed you that the Treasury expressed a desire to hear the views of the presidents and professors of the three Queen's Colleges with regard to the desirability or otherwise of applying the "65" rule to the presidents and professors of the colleges. The Treasury appointed a committee consisting of Lord Playfair, Sir Mathew White Ridley, M.P., and Sir J. Moate (direct representative of the Treasury). The committee decided on taking the evidence of the presidents of Cork, Belfast, and Galway, and of one professor from each college. Professor Jack of Cork, Professor Parser of Belfast, and Professor Townsend of Galway were selected to represent their colleagues. At a meeting of the Cork professors, Professor Jack was instructed to inform the committee (1) that the professors disapprove of the application of the "65" rule to the colleges; (2) that if the Government insist on compulsorily retiring professors, though appointed for life in accordance with the statutes of the colleges, then the professors should be called upon to retire at sixty-five, unless the council of the college should certify that the professor is quite capable of discharging his duties, the certificate to be renewable every three years; and (3) that the professors of the faculty of medicine should be entitled to pensions. With regard to the latter recommendation, I may explain that the professors of medicine, surgery, midwifery, and materia medica are not entitled to pensions on the ground that they do not devote their whole time to the college, though for that very reason their salaries are much smaller than those of the arts professors. It seems cruel, then, that after devoting the best energies of their lives to the advancement of their college they should be turned adrift by the Government when falling health or advancing years compel them to vacate their chairs. The committee met in London last week and took the evidence of the three presidents in the absence of the professors, and the evidence of the professors in the absence of the presidents. As the recommendations of the committee will have much influence on the interests of higher education in Ireland they are looked forward to with considerable interest.

Cork Medical Officers' Indemnity Fund.

The following subscriptions have been received: Incorporated Medical Practitioners' Association, London, £5 5s.; South-Eastern Branch, British Medical Association, England, £10; Dundee and District Branch, meeting, £9 4s. 6d.; Worcestershire and Herefordshire Branch, British Medical Association, £5 5s.

June 25th.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

The Consumption of Tobacco in France.

A NON-SMOKER like myself is a *rara avis* in this tobacco-loving community; no wonder, then, if the State exercises a monopoly of the sale of the fragrant and remunerative weed. The net profits accruing to the Government from the sale of tobacco during the last year attained the colossal dimensions of 366 539 875 fr. 46 c. The Nord is a long way ahead of all other departments in the smoking, chewing, and snuff-taking propensities of the inhabitants, each of whom consumes annually 2 kilogrammes 391 grammes. At the opposite end of the scale is the department of La Lozère, where the average annual consumption per head—or rather per mouth and nostrils—does not exceed 310 grammes. The consumption of tobacco for smoking and chewing purposes has increased 35 per cent. during the last twenty years, whereas the habit of snuff-taking has diminished 20 per cent. By the way, it is by no means uncommon to see students smoking in the hospital wards, and anyone who knew the late Professor Tiliat, the distinguished surgeon of the Charité, will recollect how liberal he was with his cigarette case directly the morning visit was over, whilst he was having a final chat before leaving the wards.

The Cause of the Colouration and Coagulation of Milk when Heated.

It is a matter of common observation that milk heated in contact with air for a certain time becomes coagulated and assumes a yellow tint. Heated in a water bath this phenomenon occurs in from ten to fifteen hours. When boiled, coagulation occurs, and the milk assumes a caramel tint. The coagulation takes place as soon as the yellow colouration has attained a certain intensity. Observers have ascribed these curious colour changes to alteration either of the lactose or of the casein (Duciaux), and no satisfactory explanation of the clotting has ever been advanced. MM. Cazeneuve and Haddon¹ have, in consequence of researches on the subject, arrived at the following conclusions: (1) the yellowing by heat is due to the oxidation of the lactose in presence of the alkaline salts of the milk; (2) such oxidation generates acids, amongst others, formic acid, the presence of which determines, as would that of any other acid, the coagulation of the milk; and (3) the coagulated casein is not changed, but simply coloured yellow by the brown bodies developed at the expense of the milk-sugar.

Sudden Death after Fracture of the Patella.

Dr. Cerné reports in the *Normandie Médicale* of May 15th a case in which about twenty-four hours after a *séance* of massage for simple fracture of the knee-cap the patient died quite suddenly. The necropsy revealed as the cause of death an obliteration of the pulmonary artery by large clots detached from the deep femoral vein. Although the long interval between the occurrence of the catastrophe and the final massage would appear to exonerate this form of treatment, it is more than probable that it paved the way for the migration of the clots by breaking them up. It would follow that, whereas massage is indicated very early or very late after the receipt of the fracture, it is contraindicated where, after consolidation, the limb remains œdematous and boggy. Here it is probable that the large veins contain clots which any such manœuvres are liable to displace, to the great danger of the patient.

A Delicate Test for Albumen in Urine.

A 1 in 3 solution of resorcin is strongly recommended by M. Caries² as an infinitely more delicate test of the presence of albumen in urine than nitric acid. The *modus operandi* is so simple that the practitioner can easily apply it at the bedside, the material necessary being only a test-tube, a little pipette of 2 cubic centimetres capacity, and a packet containing 1 gramme of resorcin. The gramme of resorcin is introduced into the test-tube and dissolved, with shaking, in 2 cubic centimetres of ordinary water. The urine (whatever may be its reaction) is then, by means of the pipette, allowed to gently flow on the surface of the solution, when, should albumen be present, a white ring is developed at the line of demarcation, no other colouration ever being observed. Alkaloids (unless, as is never the

case in urine, they be present in very large quantities), urates, and urea do not yield the white ring with resorcin. Peptones, however, when, as is rare, they are present in urine, give the ring, but the albumen ring remains while the peptone ring disappears when the tube is plunged into hot water. It is claimed that resorcin will give a cloudiness of albumen when nitric acid gives no result at all.

June 25th.

BERLIN.

(FROM OUR OWN CORRESPONDENT.)

The University of Jena.

THE publication of a rumour that the authorities intend to abolish the University of Jena has caused a stir in the scientific world, the university being one of the oldest in Germany and having often occupied a leading position. Financial reasons are said to have induced the authorities to arrive at this decision. The constitution of the University of Jena is somewhat peculiar. It is not under the jurisdiction of a single State, but belongs jointly to four States of Thuringia—viz., Saxe-Weimar, Meiningen, Coburg, and Altenburg. The Governments of those small States entirely control the affairs of the university. If, for instance, a new professor is to be appointed they must all consent to his nomination. To put a stop to the further propagation of this rumour the official journals of the four united Governments declare that the continued existence of this venerable university is assured both by public grants and by large donations recently made by old pupils and others. This communication has been received with general satisfaction, particularly in the town of Jena itself, which is entirely dependent upon the university.

The Resident Medical Officers of the Friedrichshain Hospital.

A conflict has arisen between the resident medical officers of this hospital and their superiors. The chief physicians and surgeons complained that the young medical men used to come home at unusually late hours, that they gave frequent festivities in the hospital, and that they were consequently not always fit for the next day's work. The resident medical men rather bravely retorted that their superiors ought to mind their own business, and declined to modify their manner of living. The matter was accordingly brought before the Municipal Hospital Board, which decreed that all the resident medical officers were to be dismissed from their appointments. Although an arrangement took place afterwards between the chief physicians and surgeons and the resident medical staff, the board nevertheless adhered to its decision, and all the resident staff will accordingly leave the hospital at the end of this month.

The Result of the Mellage Trial.

This sensational case, which I reported to you in my last letter, has led to several important consequences. The visiting physicians of the Mariaberg Asylum resigned their posts before the verdict was published, and the district officer of health has been dismissed from his appointment by the Government. The Mariaberg Asylum will entirely lose its ecclesiastical character. The provincial council intends to lease the premises, and will also undertake the care of the inmates, who for the most part belong to the poorer classes. Physicians have been already sent from other provincial asylums to attend the patients. Two of the brethren have been arrested for perjury, and will be brought before the next assizes. The clerical press, too, is unanimous in blaming the conduct of the brotherhood, and in accusing them of having brought great discredit on all branches of ecclesiastically conducted nursing. Public opinion being very much alarmed by the disclosures made during the trial, it is probable that the lunacy laws will be modified.

The Successors of Professors Thiersch and Ludwig.

Dr. Trendelenberg, Professor of Surgery in Bonn (Rhenish Prussia), will leave that town for Leipzig, where he has been elected successor to the late Professor Thiersch. Professor Trendelenberg is connected with English medicine. He began his studies in Edinburgh, where he attended botanical and zoological lectures; and from that town he went to Glasgow University to study anatomy and physiology. He finished his medical training in Berlin, but as a post-graduate returned to England in order to familiarise himself with the new antiseptic method of Professor Lister. Afterwards he became an

¹ Académie des Sciences, June 10th.² Journal des Sciences Médicales de Lille, March 23rd.

assistant to the late Professor von Langenbeck and chief surgeon of the new Friedrichshain Hospital in Berlin. His first professorial appointment was at the University of Rostock, which town he left for Bonn. His chair at the latter university will be taken by Professor Mikulicz of Breslau, formerly assistant to Professor Billroth in Vienna. The medical faculty has recently elected Professor Hering of Prague as successor to the great physiologist Professor Ludwig.

Colonial Laboratories.

The Imperial Government will bring a Bill before the Reichstag in order to establish medical laboratories in the German colonies. There is already one in Cameroon, West Coast of Africa, under the direction of Dr. Piehn, who has made several valuable researches, especially on the etiology of blackwater fever, as I mentioned in one of my recent letters. This laboratory is his private property, but he receives a subsidy from the colonial Government. Laboratories of this kind are now to be established in all the colonies, their principal purpose being the investigation of tropical diseases and tropical hygiene. The conditions of European acclimatisation in the different colonies will also be carefully examined. In addition a central institute for colonial medicine will be established in Berlin, which will receive communications from the laboratories, and will collect and publish the results of their investigations.

June 24th.

ROME.

(FROM OUR OWN CORRESPONDENT.)

Italian Hospitals.

THE LANCET has from time to time deplored the backward condition of the Italian hospitals, which (as Professor Luciani of our university has lately testified of the biological laboratories) are quite inadequate to modern requirements, whether from a humanitarian point of view or from that of medicine, scientific as well as clinical. All through the peninsula, and still more in the islands, the monotonous cry is heard from every medical school: "We are not abreast of the times. We are, even in our best-equipped hospitals, almost mediæval in our appointments." The justly distinguished school of Genoa, which, in spite of many and grave disadvantages, has sent forth surgeons and physicians of European reputation, has lately been the subject of a "Commissione d' Inchiesta," specially nominated to report on its hospitals. On that commission of inquiry are found the authoritative names of Dr. Giovanni Garibaldi (Professor of Surgical and Topographical Anatomy in the University), Dr. Canalis (Professor of Hygiene), and such eminent practitioners as Drs. Muzio, Carbone, and Ravano—men whose competence is not greater than their independence and impartiality. Their report, now made public, is a thorough-going and severe indictment of nearly all the departments of the city hospitals, in well-nigh every one of which they lament "la mancanza delle più elementari prescrizioni igieniche" (the want of the most rudimentary prescriptions of hygiene), and the slovenly manner in which the "servizio amministrativo" is carried out. The Italian public, which, as lately shown, can respond so nobly to the appeal of the Central Committee of the Red Cross, has only to become aware (through such reports as the present) of the discreditable state of the city hospitals to bring adequate pressure to bear on the Government and on the local municipalities for the worthy rehabilitation of those all-essential institutions. Relatively to the times the hospitals of Italy are far inferior to those in which her great mediæval surgeons and physicians practised and taught. Is she content to court much longer the humiliating comparison? Her penitentiary prisons are actually better appointed and better administered than her hospitals, as a recent visit to the great "penitenziario" of San Leopoldo (Leghorn) put clearly on evidence. The Commendatore dall' Oglio, the local prefect, concluded a rigorous inspection of the latter, in its sanitary and medical departments, with hearty words of praise for what he had examined and witnessed. Could he have said as much for the hospitals of the greatest city on that seaboard which is also the seat of a historical medical school?

"Death in the Pot."

We have been having a more than usually depressing turn of sirocco weather, well defined as "heat without sun, wind

without air, and rain without freshness"—conditions under which all kinds of food, particularly meat and fish, are apt to decompose. Rome, like most populous Italian cities, abounds in "rivenditori ambulanti" (itinerant retail dealers) in such articles, frequenting the poorer quarters and often eluding the vigilance of the sanitary officers in the sale of unsound comestibles. In consequence, we have from time to time cases of ptomaine poisoning after the consumption of those viands, an exceptionally tragic case of which occurred early this year in Florence, where three out of a family of four died after eating fish in a putrescent state. The other day a well-to-do Roman farmer, with his wife and four children, nearly encountered a similar fate from precisely the same cause. At midday they had partaken of some fish from the Tiber, and by the evening they were all ill—all except the youngest child, who had died of other viands. Severe intestinal pain was followed in each case by violent retching, and by eight o'clock they had to be removed for treatment to the Ospedale di Sant' Antonio. Fortunately, there was still time to evacuate the primæ viæ of their poisonous contents, and the patients, though in a deplorably reduced condition, are now doing well. But the lay press, not unjustifiably, is calling out for a more rigid censorship of these itinerant food-vendors, who buy up the unsaleable stock of the butchers and fishermen and vend it in obscure quarters on the sly. Naturally enough, it asks if it is only when the *forestieri* are in Rome that the sanitary inspectors are on the alert; and if the lives of the lieges must be endangered the moment the "foreign import" (*alias* well-to-do visitor) turns his back?

June 21st.

Obituary.

PATRICK KAVANAGH, M.D. ST. AND.

THE news of the death of Dr. Kavanagh, which took place quite suddenly at his residence in Brighton on the 25th inst., will be received with regret by a large circle of friends. Dr. Kavanagh retired from practice some years ago, having been formerly in practice at Lewisham for thirty years, and much confidence was felt in the neighbourhood to his professional skill and sound judgment. It would be impossible to speak of his benevolence and charity without apparent exaggeration, for his name will be rendered a household word with those among whom he laboured. Many officers now in the Army and Navy who were studying at the Royal Naval School, New-cross, of which he was medical officer, will remember his kindness. He was a classical and scientific scholar, as those who met him can testify. Prior to his death he was preparing an address to his supporters in Ireland, having accepted an invitation to stand as an Irish member. By his sudden decease many will have lost not only a wise adviser, but a true friend.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.—The deaths of the following eminent foreign medical men are announced:—Dr. Wölfler, Imperial Councillor, and for many years director of the Vienna Jewish Hospital.—Dr. F. von Ried, formerly Professor of Surgery in the University of Jena.—Dr. A. Takacs, *privat docent* in Medicine in the University of Budapest.—Dr. J. S. Alleyne, formerly Professor of Materia Medica and Therapeutics in the St. Louis Medical College.

THE OBSTETRICAL CONGRESS IN VIENNA.

The Development of Obstetrics.

THE Congress met on June 5th, and was attended by a great many leading medical men. Professor Chrobak of Vienna presided, and in his opening address gave a short sketch of the Development of Obstetrics, in the course of which he remarked that some questions of the physiology and pathology of pregnancy and labour were as yet imperfectly understood, such as the fetal metabolic processes, the placental nourishment and respiration, the theory of the inferior segment of the uterus, the mechanism of delivery, osteomalacia, and eclampsia. Baichard, Chamberland, and

Blanc have shown that eclampsia is caused by an intermediate metabolic product, and other authors, such as Schmorl, have assigned the formation of this virus to the liver. The researches of Drs. Ludwig and Savory have proved that during eclampsia the blood serum contains a virulent substance which is excreted by the kidney imperfectly, if at all, its composition according to Nencky and Pawhoff being $\text{CO} < \text{ONH}^+$. Professor Chrobak then

pointed out the necessity for clinical teachers of obstetrics keeping in view the interests both of the students and the patients. During 1889-94 there occurred in his clinic 18 263 births, and the puerperal fever rate was 2.2, 1.8, 5.6, 5.1, 4.4, and 4.1 per cent., the mortality being 0.13, 0.15, 0.27, 0.26, 0.16, and 0.09 per cent. He believes that digital exploration per vaginam is the only method of examination which possesses any value for the student; in his clinic every student makes from sixty to one hundred vaginal examinations in a half-year.

Rupture of the Uterus.

Herr Lunger (Leipzig) discussed Bandl's theory of the so-called inferior segment of the uterus. This is that part of the body of the uterus which projects over Douglas's fold and extends to the perimetrium and internal os uteri; during the last stage of pregnancy this narrow segment becomes funnel-shaped. The speaker endeavoured to formulate a system including all cases of rupture of the uterus. The existence of the so-called post mortem ruptures has not been satisfactorily established, as they generally result from ante-mortem spontaneous ruptures. The uterus is never spontaneously ruptured in the third stage of labour, but forcible expression of the placenta at an unsuitable time, when the uterus is relaxed and atonic, may produce laceration and contusion of the uterus, reaching to the peritoneum. In cases of incomplete rupture the peritoneum may eventually give way, and the placenta may escape into the abdominal cavity. The exterior incomplete form is the rarest, and is characterised by multiple laceration of the peritoneum and of a part of the muscular layer of the uterus. As latent rupture is a rupture of the body of the uterus which passes only through the muscular layer, reaching to the peritoneum, it is caused by direct violence. Spontaneous ruptures only affect the body of the uterus, especially the fundus and the part around the internal opening of the oviduct. Contracted pelvis, stricture of the cervix uteri, and ovarian cysts frequently cause ruptures. In the case of contracted pelvis and head presentation the patient is to be placed on that side where the head best dilates the genital canal, and she must not make bearing-down efforts. If rupture has taken place immediate delivery must be effected; but in the case of transverse presentation perforation or cephalotripsy is most favourable for the life of the mother; turning of the living child may be also tried, but when the child is dead it should be dismembered. When rupture has been diagnosed and the child is in the abdominal cavity it is to be removed by laparotomy. Neither plugging nor compression stops the bleeding. Amputation of the body of the uterus must be performed when its interior is thought to be septic or when myoma is present.

Dr. Haberdar (Vienna) showed Preparations of Ruptures caused by the introduction of instruments in criminal cases of abortion. These injuries when healed leave weak places where spontaneous rupture may appear. When dilated the uterus gives way only in places which are fixed and immobile, such as the cervix or, in the case of incarceration, in consequence of contracted pelvis or pathological adhesions.

Dr. Hofmeier (Giessen) had seen cases where rupture occurred without any fixation of the os uteri. The bearing down of the woman and pressure on the abdomen constitute a uniformly distributed force which never can produce rupture of the uterus.

Dr. Veit (Berlin) believes that the fixation of the cervix downwards is caused by the connective tissue of the pelvis.

Dr. Winkel (Munich) said that compression of the abdomen may produce rupture, but only when performed by an unpractised operator or unskilfully.

Dr. Tauffer (Budapest) found among 471 births 25 penetrating and 17 non-penetrating ruptures. He obtained gratifying results by iodoform wool pellets; but laparotomy, which was performed in four cases, was quite unsuccessful.

Professor Chrobak is opposed to plugging, for by it an incomplete rupture may be converted into a complete one. The difficulty of vaginal extirpation consists in stopping the hæmorrhage from the parametrium.

Endometritis.

Professor Winckel (Munich) presented a report on Endometritis, of which he distinguishes two groups: (1) the simple forms resulting from the action of poisonous substances, general infection of the system or abortion, and the so-called endometritis exfoliativa; and (2) the purulent and bacterial forms caused by schizomycetes and protozoa (gonococcus and tuberculous varieties), by streptococci and staphylococci, saprophytes, diphtheria, and syphilis. Simple metritis arises from the return of blood from the uterus being impeded by excessive congestion, which may occur even in childhood in consequence of unsuitable clothing, imperfect ablation of the genitals, obstinate constipation, chlorosis, æræmia, and leucæmia, whereas after the period of puberty menstrual disturbances, ectopia and neoplasmata of the uterus, and diseases of the ovary are to be taken into consideration. Hæmorrhagic endometritis is a not uncommon sequel of burns, probably in consequence of obstruction of the vessels. Poisoning produces fatty degeneration of the small arteries and extravasation of blood into the mucous membrane; portions of the membranes of the ovum left in the uterus give rise to endometritis decidua polyposa, which, when not entirely removed may, in the event of conception taking place, cause habitual abortion. In the purulent form the gonococcus most frequently attacks the urethra, then the cervix and oviducts, and rarely the vagina and vulva. From the cervix it both makes its way through the uterine wall to the peritoneum and ascends to the mucous membrane of the uterus. There is no immunity against this coccus; it occurs at every age and retains its virulence for years. Streptococcus pyogenes causes puerperal endometritis and attacks all parts of the mucous membrane of the womb, puerperal and non-puerperal, migrates through the wall of the uterus and oviducts to the peritoneum, and shows much variation according to the place of the inoculation, the number of the cocci, and the resistance of the organism. Primiparae and women exhausted by hæmorrhage and protracted labour are specially disposed to be infected by this coccus. Syphilitic endometritis is not frequent; a place favourable to the infection is the anterior lip of the os uteri. The colour of the discharge is at first clear, then reddish yellow and green. The slimy, blood-stained, or clear secretion is inodorous, but it may become fetid by putrefaction. The pains resemble labour pains or uterine colic, and local pains also result from the engorgement of the secretion. The pains of exfoliative endometritis are characteristic, beginning before menstruation and being described as burning and itching in character; they are, moreover, associated with pains in the loins and inguinal region and with headache. Sterility as a consequence of endometritis results from swelling of the mucous membrane or retention and purulent charges of the secretion. Endometritis interferes with delivery by causing anomaly of the labour, premature rupture of the fetal membranes, premature loosening of the placenta, and at last stenosis and atresia of the cavity of the uterus. In respect of duration endometritis may be acute, subacute, or chronic. At first the simple and purulent forms show an acute stage with variable fever and a slimy secretion becoming serous and fetid. The greater part pass into the subacute condition, especially those cases which are caused by abortion or premature birth. The endometritis of chlorosis and æræmia is at first acute or subacute, and eventually becomes chronic.

Dr. Wertheim (Vienna) spoke on the subject of Gonorrhœa of the Uterus. This is generally preceded by an inflammation of the mucous membrane of the uterus—endometritis interstitialis. Inflammatory processes of the muscular layer also occur, such as infiltration of the muscular connective tissue, which causes hyperplasia of the connective tissue at the expense of the muscular layer.

Dr. Fehling (Halle) described the Treatment of Endometritis. In puerperal endometritis vaginal injections are to be made with lysol, carbolic acid (0.5 to 2 per cent.) or corrosive sublimate (1 part in 4000), the latter being contraindicated in nephritis or æræmia. The contact of the nozzle of the injection apparatus with the vaginal portion of the uterus produces contraction sufficient to discharge the secretion. But if within twenty-four hours the symptoms do not subside the uterus is to be injected with from 2 to 3 litres of a tepid 0.5 per cent. solution of lysol. Dr. Fehling recommends abrasion of the uterus only in endometritis occurring in the second week of childbed (caused by retained fragments of the membranes and placenta), and in endometritis after abortion. After the abrasion cauterising with a 50 per cent.

solution of carbolic acid in alcohol is to be performed. The treatment of the other acute forms of endometritis consists in repose, the use of ice, laxatives, morphine, or codéine, and brushing of the cervix with a 10 per cent. solution of nitrate of silver. Chronic endometritis is to be treated by tincture of iodine (10 to 20 per cent.), or a 50 per cent. solution of carbolic acid in alcohol. Gratifying results may also be obtained by an electric current of from 20 to 50 milliamperes, the anode being introduced into the cavity of the uterus, and the cathode being laid on the abdomen; this method is specially applicable to climacteric bleedings attended by necrosis and scars of the mucous membrane.

Vomiting of Pregnancy.

Dr. Tuszkai (Budapest) presented a report on the Vomiting of Pregnancy (hyperemesis gravidarum). Vomiting without any complication is caused by a local peritoneal irritation and leads to inanition, decrease of the weight of the body, and diminished secretion of urine. He combats it with small doses of opium, the local application of cold, or the induction of premature labour by means of a double-current apparatus of Hegar's pattern, through which water passes at a temperature of 50° or 60° C.

Other papers.—At the final sitting Dr. Schanta (Vienna) made some observations on adnex operations. The results have not been satisfactory, for only 56 per cent. of the patients were permanently benefited; the remainder complain of leucorrhœa, hæmorrhage, and pains. In these cases there were adhesions of the intestine, urinary bladder, and omentum to the pelvic organs.

Dr. Erlach (Vienna) presented a report on sixty-nine cases operated on for Myoma of the Uterus.

Dr. Sünger discussed Humid Asepsis in the Abdominal Cavity. He has obtained good results by Tavel's solution, which contains 7.5 parts of common salt and 2.5 of soda in 1000 parts of water.

Dr. Winter (Berlin) spoke on the subject of Gastrorrhaphy and Abdominal Hernia. The mortality of hernia treated by laparotomy, which formerly amounted to one-third of all cases operated on, has now fallen to 8 per cent.; an exact suturing of the aponeurosis with catgut is of great importance.

Dr. Klein (Munich) described the Anatomy and Histology of the Urethra. In the vestibulum vaginæ there are three species of glands—Skene's and Bartholin's, and the simple acinous mucous glands. Skene's glands are analogous to the prostatic glands in the male, those of Bartholin to Cowper's glands, and the mucous glands to Littre's. Males and females, therefore, possess analogous glandular structures.

Many other papers were also read before the Congress, but we are compelled by exigencies of space to leave them unrecorded. The reception on behalf of the profession of Vienna was very cordial. The next Congress of the Obstetrical Society will take place in 1897 at Leipzig. The subjects to which special attention will be directed are retroflexion of the uterus and placenta prævia. The following gentlemen were elected officers of the society:—President, Dr. Zweifel; vice-president, Professor Chrobak; manager, Dr. Schatz; and secretaries, Drs. Pfannen-schmied and Sünger.

Medical News.

SOCIETY OF APOTHECARIES OF LONDON.—The following candidates have passed in the undermentioned subjects:—

Surgery.—J. Blackwood, University College; F. H. Blatchford, St. Mary's Hospital; F. E. Bromley, London Hospital; B. L. Duingra, Lahore; A. P. Eldred, St. Mary's Hospital; A. H. Huckle, Guy's Hospital; W. B. Maurice, St. Mary's Hospital; A. H. Palmer, Birmingham and Guy's Hospital; R. G. Worger, Bristol and Guy's Hospital; A. M. St. J. Wright, Masters.
Medicine, Forensic Medicine, and Midwifery.—J. Blackwood, University College; M. A. Cooke, St. Bartholomew's Hospital; R. A. Fegan, St. Bartholomew's Hospital; A. H. Palmer, Birmingham and Guy's Hospital; C. J. Palmer, Birmingham and Liverpool.
Medicine and Midwifery.—J. W. Clegg, Manchester; R. B. Rees, Middlesex Hospital.
Medicine.—E. A. B. Poole, Birmingham.
Forensic Medicine and Midwifery.—W. A. Montgomery, St. Thomas's Hospital; C. Blue, Belfast.
Forensic Medicine.—H. G. C. Hardwick, Cambridge and St. Thomas's Hospital; J. A. Morgan, Charing-cross Hospital; R. G. Worger, Bristol and Guy's Hospital.
Midwifery.—T. H. Wilkins, Charing-cross Hospital.

To Messrs. Blackwood, Cooke, Clegg, Fegan, Hardwick, Huckle, Morgan, A. H. Palmer, Rees, and Worger was granted the diploma of the society entitling them to practise Medicine, Surgery, and Midwifery.

FOREIGN UNIVERSITY INTELLIGENCE.—**Bordeaux:** MM. Binand and Braquahaye have been appointed *professeurs-agrégés* of Surgery.—**Freiburg:** Dr. Schüle has been recognised as *privat-docent* in Medicine and Dr. Keerlinck as *privat-docent* in Surgery.—**Kazan:** Dr. V. Kuzmin of Moscow has been appointed to succeed Professor Levshin in the chair of Surgery.—**Lille:** M. Oui has been appointed *professeur-agrégé* of Midwifery.—**Lyons:** MM. Vallas and Curtillet have been appointed *professeurs-agrégés* of Surgery.—**Montpellier:** M. G. de Rouville has been appointed *professeur-agrégé* of Surgery, and MM. Paech and Vallois *professeurs-agrégés* of Midwifery.—**Montevideo:** Dr. L. Morquio has been appointed to the chair of Internal Pathology, Dr. Pouey to that of Clinical Gynaecology, Dr. Navarro to that of Operative Medicine, and Dr. G. Sinarelli of Sienna to that of Hygiene.—**Paris:** M. Bonnaire has been appointed *professeur-agrégé* of Midwifery, and MM. Broca, Hartmann, and Walther *professeurs-agrégés* of Surgery.—**Nancy:** MM. Schuhl and Froelich have been appointed *professeurs-agrégés* respectively of Midwifery and Surgery.—**St. Petersburg (Military Medico-Chirurgical Academy):** Dr. Ludowski has been appointed to the chair of Histology and Embryology.—**Siragossa:** Dr. Luis Gudea of Barcelona has been appointed to the Chair of Clinical Midwifery.—**Sienna:** Dr. Falaschi has been promoted to be Ordinary Professor of Midwifery.—**Toulouse:** M. Aldibert has been appointed *professeur-agrégé* of Surgery.—**Turin:** Dr. Sansoni has been recognised as *privat-docent* in Medical Pathology, Dr. Roncoroni as *privat-docent* in Psychiatry, and Dr. Vicarelli as *privat-docent* in Midwifery and Gynaecology.

MEDICAL MAGISTRATES.—Dr. Joseph A. Bowen and Dr. John Lonie of Preston, Lancashire, have been placed on the Commission of the Peace for that borough.—Dr. James John Graham of Garstang, Lancashire, has been placed on the Commission of the Peace for the county of Lancaster.

A QUARTERLY MEETING of the Society for the Study of Inebriety will be held in the rooms of the Medical Society of London, 11, Chandos-street, Cavendish-square, W., on Thursday, July 4th, 1895, at 4 o'clock p.m., when Dr. Norman Kerr, M.D., F.R.S., will open a discussion on the Government New Inebriates Bill, 1895.

ROYAL METEOROLOGICAL SOCIETY.—The last meeting of this society for the present session was held on the 19th inst. at the Surveyors' Institution, Westminster. Mr. R. Inwards, F.R.A.S., President, being in the chair. Mr. R. H. Curtis, F.R. Met. Soc., read a paper on the Hourly Variation of Sunshine at Seven Stations in the British Isles, which was based upon the records for the ten years 1881-90. Falmouth is decidedly the most sunny station of the seven, having a daily average amount of sunshine of 4½ hours. This amount is half an hour more than that recorded at Valencia and three-quarters of an hour more than at Kew. Of the other four stations, Aberdeen, the most northern but at the same time a coast station, with 36½ hours, has more than either Stonyhurst or Armagh, both inland stations; whilst Glasgow, with only 3 hours, or about a quarter of its possible amount, has the smallest record of the seven, a result to some extent due to the nearness of the observatory to the large manufacturing works with which the city of Glasgow abounds. At Valencia, Kew, Stonyhurst, and Armagh the maximum duration is reached in May, the daily mean amount varying in the order named from 6¼ to 6 hours. At Falmouth and at the Scotch stations the increase goes on to June, when the mean duration at Falmouth reaches 7½ hours, at Aberdeen 6½ hours, and at Glasgow 5½ hours. January and December are the most sunless months of the year. The most prominent feature brought out at all the stations is the rapid increase in the mean hourly amount of sunshine recorded during the first few hours following sunrise and the even more rapid falling off again just before sunset.—Mr. H. Harries, F.R. Met. Soc., read a paper on the Frequency, Size, and Distribution of Hail at Sea. He has examined a large number of ships' logs in the Meteorological Office, and finds that hail has been observed in all latitudes as far as ships go north and south of the equator, and that it seems met with it over wide belts on the Polar side of the 35th parallel.

PROFESSOR HUXLEY.—We regret to learn that Professor Huxley's condition remains one that gives cause for the gravest anxiety. He is very exhausted, and the symptoms directly dependent upon insufficient action of the kidneys are still present. There is constant nausea, and on Thursday signs of pericarditis became manifest. He is, however, not drowsy, and his mind is quite clear. The rally of the early part of the week has proved of a temporary character.

SERVICES APPRECIATED.—Mr. John Ashburton Thompson, M.D. Brux., D.P.H. Camb., L.R.C.P. Lond., M.R.C.S., of Sydney, New South Wales, has been awarded a prize of fifty guineas by the National Leprosy Commission for his researches with regard to leprosy.

PRESENTATION.—Mr. George Watson H. Tawse, M.B. Aberd., house surgeon at the Whitehaven and West Cumberland Infirmary, Whitehaven, was presented, on the 11th inst., by the members of the Whitehaven Police St. John Ambulance Class, with a handsome dressing-case and meerschaum cigar-holder, in appreciation of a course of lectures given to the class on "First Aid."

THE GRAND PRIORY OF THE ORDER OF THE HOSPITAL OF ST. JOHN OF JERUSALEM IN ENGLAND.—On Monday last, being St. John the Baptist's Day, the members and honorary associates of the Grand Priory of the Order of the Hospital of St. John of Jerusalem in England, of which Her Majesty the Queen is the sovereign head and patron, and His Royal Highness the Prince of Wales Grand Prior, met together for their annual festival. After the celebration of the Communion at 10.15 A.M. a service was held in St. John's Church, Clerkenwell, built on the site of the Church of the Old Priory of the Order, the original crypt belonging to which still remains and was last year restored and lighted through the munificence of the late Sir Edmund A. H. Lechmere, Bart., M.P., a distinguished member of the Order. The service was conducted by the Rev. Thomas W. Wood, a chaplain of the Order and rector of St. John's, assisted by the Right Rev. the Bishop of Gibraltar, the Rev. Canon Whittington, M.A., the Rev. Paul W. Wyatt, M.A., the Rev. Sir Borodale Savory, Bart., M.A., the Rev. Edgar Sheppard, M.A., and the Rev. Canon Teignmouth Shore, M.A., all chaplains of the Order, the latter of whom preached the sermon, taking as his text St. Matthew, Chapter xi., verse 7. After the commemoration service the members present inspected the crypt, and in the afternoon, by permission of the Rev. Canon Elwyn, Master of the Charterhouse, the general assembly of the Order was held in that historical building, the Earl of Lathom, G.C.B. (Chancellor of the Order), presiding. Reports having been read on the work of the Order and its various departments, including the British Ophthalmic Hospital at Jerusalem and the St. John Ambulance Association, a demonstration of ambulance work was given in the grounds of the Charterhouse by members of the metropolitan corps of the St. John Ambulance Brigade, under the direction of the Commissioner, Colonel E. T. Thackeray, R.E., C.B., V.C., exemplifying in a very marked manner the great utility of the training received by its members. In the evening the confreres and ladies of the Order dined together at the Imperial Institute.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

The Midwives Registration Bill.

THIS Bill was amended on report on the 20th inst., and is now printed as amended. The changes show a disposition to meet the views of the General Medical Council. One of these, in Subsection 5 under Clause 12, has reference to removal from the Register, and reads as follows:—"For the purpose of this section professional misconduct shall, in addition to any other misconduct, include any omission to send for a medical practitioner where the case is not one of natural labour." The sudden interruption of all legislative work of Parliament makes it hopeless to expect further progress for this measure in the present session. We may, therefore, leave for the present any further notice of the changes introduced into the Bill.

Resignation of the Ministry.

Lord Rosebery in the House of Lords, and Sir William Harcourt in the House of Commons, announced on Monday, June 24th, that the

Ministry had resigned in consequence of the adverse vote in Committee of Supply on the previous Friday evening. The Marquis of Salisbury is now engaged forming a new Ministry.

Fatal Accidents Inquiry (Scotland) Bill.

The Grand Committee of the House of Commons for the consideration of Scotch Bills met on Monday, June 24th, and disposed of the remaining clauses of the Fatal Accidents Inquiry (Scotland) Bill.

HOUSE OF LORDS.

FRIDAY, JUNE 21ST.

Inebriates Bill.

There was a short debate at this sitting on the order for the second reading of the Inebriates Bill. The Lord Chancellor (Lord Herschell), in moving the second reading, said the Bill was free altogether from party aim or party origin. It was founded on the recommendations of the two committees which had dealt with the subject. He doubted whether anyone could be found to say that our present method of dealing with those who were convicted of habitual drunkenness was satisfactory. It appeared that out of 33,000 women who were every year on an average sent to prison for drunkenness 11,000 had not less than ten convictions recorded against them; and of the men 16,000 had each undergone not less than the same number of imprisonments. In one of the London prisons there were at the time the return was prepared 165 women who had been committed from 40 to 133 times in the course of a year. One woman had only a week's liberty during twelve months, although all her sentences had been very short ones. Another woman in the course of a year and eight months was convicted such a great number of times that she spent five separate months and 138 days of that period in prison. It was certain that our present system of dealing with those cases entirely and absolutely failed. It neither cured nor deterred; and if it did not do the one or the other it failed absolutely for the purpose for which imprisonment was designed. Sir Andrew Clark, in his evidence before the Home Office Committee, put the case very truly when he said that short sentences had only the effect of strengthening the organisation to enable such people to indulge in more drunken bouts when they got out; that in nine out of ten cases there was an orgie on the very day of their escape from prison; and that short sentences were useful for no purpose but the purpose of revenge. The present system had therefore failed. The Bill proposed to deal with two classes of habitual drunkards—those who had rendered themselves amenable to the criminal law and those who had not rendered themselves so amenable. The proposal of the Bill was that a habitual drunkard, who had been repeatedly convicted for drunkenness, should be detained in an inebriate reformatory for a period of not less than twelve months. No one would say that twelve months' imprisonment under the ordinary conditions of imprisonment should be imposed even for repeated drunkenness or offences connected with drunkenness. But to deal with habitual drunkards in an inebriate reformatory, in which the object was by a lengthened period of detention to effect a cure, was, it appeared to him, a different matter, and one which would not shock any sense of justice or propriety. The maximum period of five years mentioned in the Bill was a mistake: it should have been three years. This, however, was a detail, and the only principle involved was that the period should be sufficiently long to be useful for the purpose of a cure. With regard to those who had not rendered themselves amenable to the law the Bill contained provisions which no doubt were of a serious and stringent character. At the present time there might be detention in a retreat, but it was a voluntary detention. The Bill proposed to permit detention to be obtained compulsorily by an order of the Court in the case of those who were habitual drunkards. The application might be made either to the county court or to the High Court. If made to the county court an order made might be appealed against to the High Court; therefore it might be said that, except by order of the High Court, no person could, in the last resort, be subjected to detention in a retreat under the provisions of the Bill. The Bill proposed that the minimum of detention should be twelve months and the maximum two years, but there was further provision that during the time of detention the person detained might be allowed to be at large in order to ascertain whether the time had come when he might safely be let at liberty. The Bill also proposed, following the recommendations of the committee, that the Court should have power to appoint a person to take charge of the property of a person in the retreat, if thought fit, during the time of detention. The idea that compulsion was expedient did not rest upon the opinion merely of the two committees. Before the Home Office Committee there were placed the remarks of a number of boards of guardians, all in favour of compulsory detention, and there were many representations of justices of the peace in the same direction. The question really was whether there was any reasonable prospect of a cure in cases of habitual drunkenness by means of detention. On that point it seemed to him the evidence was very strong, although it was necessarily limited in its character. In the first place he would call attention to the memorial of a number of eminent medical men, which was presented to the Home Office Committee, on whose report this Bill was largely founded. That memorial was signed by medical men of the highest eminence, including Sir William Jenner and Sir Henry Acland. A number of the most eminent medical authorities signed a memorandum expressing an earnest desire for the compulsory restraint—with all proper safeguards—of those men and women who could not control themselves in this direction, and expressing the opinion that much good might be done if compulsory detention could be enforced for a sufficient time. These medical authorities must come in contact with a great number of these unfortunate people, being consulted by the friends and relatives, and their opinion was of great weight. He was fully alive to the fact that there were plenty of details in the Bill open to criticism, and perhaps to condemnation, but all that was asked for now was a second reading of the Bill. If the House came to the conclusion that it was not safe to deal with the non-criminal cases, though he hoped that would not be their conclusion, still they could hardly doubt that an effort ought to be made to deal with the criminal cases so as to make the law more rational and productive of good.

Lord Halsbury thought there were portions of the Bill which might

with advantage be passed into law. He was ready to support the Lord Chancellor in some form of legislation (he did not think this Bill was the best form) for those habitual drunkards who had disobeyed the law and therefore forfeited their right to free action. This Bill, however, was a most serious and extraordinary innovation. It was nothing more nor less than a repeal of the Habeas Corpus Act. He would be very glad indeed if there was such an institution in England as the French *conseil de famille*; but to say that anyone who pleased might apply to a county court judge to shut up somebody else appeared to him to be the very extravagance of legislation, and if the Bill had not comprehended what he conceived to be a proper subject for inquiry he should have moved its rejection altogether. He did not, however, propose to take that course, and had only indicated generally what the line of his opposition to the measure was. He had only further to say that he hoped that that part of the Bill to which he had taken exception would be thrown out by their lordships.

Lord Ashbourne, while appreciating the motives that had suggested the Bill, said that in its present shape it was full of dangers and lent itself to grave abuses.

The Lord Chancellor, in some further remarks, said his noble friend (Lord Halsbury) seemed to think that a man had a perfect right to be a habitual drunkard if only he did not go into the streets or some public place and break the law. He differed from that view entirely. There were cases—it was difficult to define them—in which a habitual drunkard, whether husband or wife, seemed to be worse than many criminals. The children neglected, the father or mother having to send them away, clothes pawned, the children often left for a time without food—not to such an extent as to amount to cruelty in the eye of the criminal law, but violating every possible duty a father or mother could owe to children or husband and wife to one another—he regarded that as a most serious and terrible state of things. If they could deal with cases of that description, if they could mitigate such misery, it was worth while making an effort, even running some risk, to do so. They could not have legislation without a certain risk, though by all means let the risk be limited as much as possible.

The Marquis of Salisbury warned their lordships that in this matter they were meddling with edged tools, and hoped that the first three clauses of the Bill would not, at least in their present form, ever appear on the Statute Book.

The Earl of Kimberley appealed to their lordships to give the Bill a second reading in order that an attempt might be made to deal with what was admittedly a difficult question.

The Bill was then read a second time.

HOUSE OF COMMONS.

THURSDAY, JUNE 20TH.

The Rations of the Army.

Mr. Campbell-Bannerman, in reply to Mr. Fuller, said that no complaints as to the quality of rations supplied to the troops at home had reached the War Office, and there was every reason, judging by the ration inspectors' reports, to believe that the rations were of very good quality. Since 1882 there had been a steady progressive improvement in the food of the soldier. This was due partly to a better quality being supplied owing to a system of surprise visits by expert ration inspectors having been adopted, and partly to the instruction which had been given to regimental officers in inspection of meat in the Army Service Corps School of Instruction at Aldershot. Greater care was also now taken in cooking and in utilising all portions of rations according to a system which was begun in Ireland by Colonel Burnett, and afterwards brought to perfection at the Army School of Cookery at Aldershot. It was the duty of the officer in command to prevent food which was not good from being served out to the men. There had certainly been no difference under successive Governments in respect of the food arrangements beyond the steady improvement to which he had referred.

Disinfecting Dairy Produce.

Sir Mark Stewart asked the President of the Board of Agriculture if he could inform the House what precautionary measures, if any, were adopted by Holland, Denmark, Australia, New Zealand, or other foreign or colonial countries for the disinfecting of dairy produce imported into this country, and what security this country had as to immunity from disease when receiving such produce.—Mr. Shaw-Lefevre, replying for Mr. Herbert Gardner, said he had no information as to what precautionary measures of disinfection were applied to dairy produce in the countries referred to, nor was he aware how such measures of disinfection could be applied to the many articles of dairy produce that came to this country. In some of the countries, however, the milk was sterilised.—Sir Mark Stewart asked if the Government proposed to take any measures or make any inquiry with regard to this important matter.—Mr. Shaw-Lefevre said that at present there was no intention of introducing any measure on the subject.—Mr. Hanbury asked if the Government would make inquiries, and see that the same protection was afforded to people of this country as was afforded in most foreign countries.—Mr. Shaw-Lefevre said that was a matter of argument.

FRIDAY, JUNE 21ST.

Vision Tests for Railway Servants.

Mr. Bryce, replying to Sir James Carmichael, said that the Board of Trade had no power to insist upon the adoption by railway companies of any particular system of tests; the companies must use their discretion in the matter. The Board of Trade had, however, felt it their duty to press upon the attention of the companies the recommendations on the subject made by such an authoritative body as a committee of the Royal Society.

Sunstroke at Aldershot.

Mr. Jeffreys asked the Secretary for War whether his attention had been drawn to the deaths from sunstroke of two soldiers at Aldershot; whether, on Saturday, June 8th, companies of Regulars and Volunteers had to march from Weybridge to Bixley, a distance of twelve miles, under a burning sun, in consequence of which several men were invalided; what was the extent and nature of the medical aid obtainable on the ground on June 8th; and what, if any, provision had been made for the relief of any sufferers amongst the 700 or 800 men engaged in the firing competition on that day; and

whether in future these long marches during the heat of the day would be discontinued except in cases of necessity.—Mr. Campbell-Bannerman replied that his attention had been called to this melancholy occurrence. There was a rifle competition at Bixley on Saturday, June 8th, and under the terms of the competition competitors had to march eleven miles, but there was no compulsion to do so beyond emulation. This was not a long march, and there did not appear to be any reason to interfere with the conditions of a voluntary competition on account of this most regrettable incident. Ample medical aid was at hand, and, as a matter of fact, was afforded by the medical officer of the Guards from the adjacent Guards' camp at Pirbright.—Mr. Gibson Bowles suggested that the right honourable gentleman might give his attention to the subject of a more reasonable headgear for the private soldier than the present forage cap.

Appointments.

Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, for publication in the next number.

ADAMS, GEORGE, M.R.C.S., has been appointed Medical Officer by the Long Ashton District Council.
BIRD, FRID, D., M.B., Ch.B., Ch.M. Melb., M.R.C.S. Eng., has been appointed Lecturer on Surgery to the Melbourne University, Victoria, Australia.
BRODIE, WILLIAM B., M.B., M.S. Glasg., has been appointed Assistant House Surgeon and Dispenser to the Worcester Infirmary.
CLUBBE, CHAS. P. B., L.R.C.P. Lond., M.R.C.S. Eng., has been appointed Honorary Surgeon to the Prince Alfred Hospital and also Lecturer in Clinical Surgery at the Sydney University, New South Wales.
CRAIG, G., M.B., M.S. Edin., has been appointed Assistant Medical Officer to the Lunatic Asylum at Seaciff, near Dunedin, New Zealand.
CRAWFORD, A. D., M.B., C.M. Glasg., has been appointed Medical Officer to the Marston Green Homes.
DAVIS, S.D., M.B., C.M. Edin., has been appointed Resident Medical Officer of the Toodyay district, Western Australia, vice Mayhew, resigned.
FOSTER, WILLIAM, M.B., D.P.H. Camb., M.R.C.S., has been appointed Medical Officer by the Shipley District Council.
GRAHAM, JAMES, M.D., Ch.M. Edin., has been appointed Honorary Assistant Physician to the Prince Alfred Hospital, Sydney, New South Wales.
HALL, G., M.D., C.M. Edin., has been appointed Medical Officer of Health by the Hambleton Rural District Council.
HARRIS, JOHN W., L.R.C.P. Lond., M.R.C.S., has been reappointed Medical Officer for the Frittsenden Sanitary District of the Cranbrook Union.
HART, J. W., M.B., Ch.M. Edin., has been appointed Medical Officer to the Hospital at Barraba, New South Wales.
HASWELL, JOHN F., M.B., C.M. Edin., M.R.C.S., has been appointed Medical Officer of Health for the Penrith Rural Sanitary District, vice Robertson.
HILLARY, ARTHUR, L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer of Health for the Pontefract Urban Sanitary District, vice Buncle.
HODGSON, THOS., M.B., Ch.B. Melb., has been appointed Honorary Assistant Demonstrator of Anatomy to the Melbourne University, Victoria, Australia.
HUNTON, FRED, M.D., M.B., B.S. Durh., has been appointed Medical Officer for the Stockton Parochial District.
JONES, HENRY T., L.R.C.P., M.R.C.S., has been appointed Medical Officer of Health to the Pembroke Rural District Council.
KING, F. T., M.B., Ch.M. Edin., has been appointed Medical Superintendent to the Lunatic Asylum at Seaciff, near Dunedin, New Zealand.
MACKNIGHT, C. C., M.B., Ch.M. Edin., has been appointed Health Officer for Carisbrook, Victoria, Australia.
MCGEE, WM., L.K.Q.C.P., L.R.C.S., L.M. Irel., has been appointed Officer of Health for the Shire of Poowong and Ietcho, Victoria, Australia.
NEWALL, W. A., M.B., Ch.B. Vict., has been appointed Assistant House Surgeon to the Leicester Infirmary.
ROBINSON, THOS. H., M.D., Ch.M. Edin., has been appointed *pro tem* Acting Resident Medical and Quarantine Officer, at Albany, Western Australia.
SANGSTER, JOHN I., L.R.C.P., L.M. Edin., M.R.C.S. Eng., has been appointed a Public Vaccinator for the district of Burra, South Australia.
SINCLAIR, ROBT. F., M.B., C.M. Edin., has been appointed Government Medical Officer and Vaccinator for the District of Brewarrina, New South Wales.
SMYTH, ERNEST J., M.B., B.S. Lond., B.Sc., L.R.C.P. Lond., M.R.C.S., has been appointed Assistant Medical Officer to the Parish of Birmingham Infirmary, vice Tipping, resigned.
SPICER, R. H. S., M.D. St. And., L.R.C.P. Edin., M.R.C.S., has been appointed Medical Officer for the Third Sanitary District of the Southampton Union.
STRADLING, W. A., M.R.C.S., has been appointed Surgeon to the Walford and Abbot Langley Sections of the Herts Police.
TERRING, EDWARD T., F.R.C.S. Eng., L.R.C.P. Lond., has been appointed Honorary Assistant Gynaecological Surgeon to the Prince Alfred Hospital, Sydney, New South Wales.
WEBBER, H. W., M.D. Lond., B.S., L.R.C.P., M.R.C.S., has been appointed a Divisional Surgeon to the Herts County Police.
WHITE, A. T., L.R.C.P., L.R.C.S., L.M. Edin., has been appointed *pro tem* Resident Medical Officer at Fremantle, Western Australia.
WOOD, W. A., M.B., Ch.B. Melb., L.R.C.P., D.P.H. Eng., has been appointed Honorary Assistant Demonstrator of Anatomy to the Melbourne University, Victoria, Australia.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

- BIRMINGHAM GENERAL DISPENSARY.**—Resident Surgeon. Salary £150 per annum, with an allowance of £30 per annum for cab hire, and furnished rooms, fire, lights, and attendance.
- BRADFORD INFIRMARY AND DISPENSARY.**—Honorary Physician.
- CANCER HOSPITAL (tree), Fulham-road, S.W.**—House Surgeon for six months. Salary at the rate of £30 per annum, with board and residence.
- CHARLOTTE HOSPITAL FOR WOMEN AND CHILDREN, Ludhiana, Punjab, India.**—Fully qualified Woman Doctor. Applications to Dr. Greenfield, 7, Heriot-row, Edinburgh.
- GLAMORGANSHIRE AND MONMOUTHSHIRE INFIRMARY, Cardiff.**—Assistant Resident Medical Officer for six months. Board, washing, and apartments provided.
- GUY'S HOSPITAL MEDICAL SCHOOL, London.**—Lecturer on Public Health.
- HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton.**—Resident Medical Officer. Salary £200 per annum, with board and residence.
- LONDON HOSPITAL, Mile End, E.**—Medical Electrician.
- LONDON HOSPITAL MEDICAL COLLEGE, Mile End, E.**—Senior Demonstrator of Physiology. Salary £100 a year and a proportion of the fees paid for classes. Also Assistant Demonstrator of Physiology. Salary £20 a year.
- LONDON TEMPERANCE HOSPITAL, Hampstead-road, N.W.**—Assistant Resident Medical Officer for six months. Board, washing, and residence in the hospital is provided, and an honorarium of five guineas at the expiration of that term will be given.
- MALING RURAL DISTRICT CONSULTANT.**—Medical Officer of Health. Salary £100 per annum, to include all office and traveling expenses. Applications to the Clerk, West Malling.
- MID-LOTHIAN AND PRESTON DISTRICT ASYLUM AT ROSSLYNLEE.**—Assistant Medical Officer. Salary, £100 per annum, with furnished apartments, board, and washing. Applications to the Clerk and Treasurer, 19, Heriot-row, Edinburgh.
- NATIONAL SANATORIUM FOR CONSUMPTION AND DISEASES OF THE CHEST, locally situated at Bournemouth.**—Resident Medical Officer. Salary £30 per annum, with board, lodging and washing.
- NEWPORT AND MONMOUTHSHIRE INFIRMARY, Newport, Mon.**—House Surgeon. Salary £100 per annum, with board and residence. No stipendium provided.
- ROYAL VICTORIA HOSPITAL, Bournemouth.**—House Surgeon and Secretary for two years. Salary £100 per annum, with board.
- SHEFFIELD UNION.**—Junior Assistant Medical Officer, unmarried, for the Workhouse Infirmary, Fir Vale, Sheffield, for six months. Furnished apartments in the Infirmary and board and washing provided.
- ST. COLINE MAJOR UNION.**—Medical Officer and Public Vaccinator for the Fifth District of the Union. Salary £20 per annum, with the usual extra medical fees and successful vaccinations. Applications to the Clerk to the Guardians, St. Coline.
- SUFFOLK GENERAL HOSPITAL, Bury St. Edmunds.**—House Surgeon. Salary £100 a year, with board, lodging, and washing.

Births, Marriages, and Deaths.

BIRTHS.

- BULLOCK.**—On June 25th, at Eastgate House, Warwick, the wife of Roger Bullock, M.R.C.S., of a son.
- CALVERT.**—On June 18th, at Queen Anne-street, the wife of James Calvert, M.D., of a daughter.
- CARR.**—On May 20th, at Juma, Ispahan, Persia, the wife of D. W. Carr, of a son.
- DOVE.**—On June 20th, at Stapleton-hall-road, Stroud Green, the wife of Percy W. Dove, M.R.C.S., L.R.C.P., prematurely, of a son, which only survived its birth a few hours.

MARRIAGES.

- GRIFFITHS—PAYNE.**—On June 20th, at St. George's, Hanover-square, by the Rev. W. A. Pywell, M.A., Rector of Whitox, assisted by the Rev. A. E. Hermann, M.A., Dr. Joseph Griffiths, King's College, Cambridge, to Ethel Mary, youngest daughter of F. Payne, J.P., Water Hall, Whitox, Suffolk.
- MABERLY—BAM.**—On May 18th, at the Dutch Reformed Church, Petersburg, Transvaal, John Mabery, M.R.C.S., L.R.C.P. Eng., of Bulawayo, Matabeleland, to Maria Johanna, eighth daughter of John H. Bam, of Cape Town, South Africa.
- TROW—HUTCHISON.**—On June 18th, at St. Andrew's Church, Aberdeen, Augustus Vivian Trow, M.B., C.M. Aberd., of Devozes, Wilts, to Katharine Arbutnot, eldest daughter of Thomas Hutchison, Ingleside, Cults.

DEATHS.

- KAVANAGH.**—On June 24th, suddenly, at Brighton, from aortic rupture, Patrick Kavanagh, M.D. St. And.
- SYLVESTER.**—On June 24th, at the Court House, Trowbridge, Wiltshire, George Malet Sylvester, M.R.C.S., in his 75th year.
- WILLIAMSON.**—On June 18th, at Elm-road, Clapham, Surrey, William Crawford Williamson, LL.D., F.R.S., late Professor of Botany in Owens College, Manchester, aged 76.

N.B.—A fee of 6s. 4d. charged for the insertion of Notices of Births, Marriages, and Deaths.

METEOROLOGICAL READINGS.

Medical Diary for the ensuing Week.

OPERATIONS.

METROPOLITAN HOSPITALS.

- MONDAY.**—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), St. George's (1 P.M.), St. Mark's (2 P.M.), Chelsea (2 P.M.), Samaritan (Gynecological, by Physicians, 2 P.M.), Sobro-square (2 P.M.), Royal Orthopaedic (2 P.M.), City Orthopaedic (4 P.M.).
- TUESDAY.**—London (2 P.M.), St. Bartholomew's (1.30 P.M.), Guy's (1.30 P.M.), St. Thomas's (3.30 P.M.), Westminster (2 P.M.), West London (2.30 P.M.), University College (2 P.M.), St. George's (1 P.M.), St. Mary's (1.30 P.M.), St. Mark's (2.30 P.M.), Cancer (2 P.M.), Gt. Northern Central (2.30 P.M.).
- WEDNESDAY.**—St. Bartholomew's (1.30 P.M.), University College (2 P.M.), Royal Free (2 P.M.), Middlesex (1.30 P.M.), Charing-cross (5 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), King's College (2 P.M.), National Orthopaedic (10 A.M.), St. Peter's (2 P.M.), Samaritan (2.30 P.M.), Gt. Ormond-street (9.30 A.M.).
- THURSDAY.**—St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), University College (2 P.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), London (2 P.M.), King's College (2 P.M.), Middlesex (2 P.M.), Sobro-square (2 P.M.), North West London (2 P.M.).
- FRIDAY.**—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), King's College (2 P.M.), Cancer (2 P.M.), Chelsea (2 P.M.), Gt. Northern Central (2.30 P.M.).
- SATURDAY.**—Royal Free (9 A.M. and 2 P.M.), Middlesex (1.30 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), University College (9.15 A.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), Cancer (2 P.M.).
- At the Royal Eye Hospital (2 P.M.), the Royal London Ophthalmic (10 A.M.), the Royal Westminster Ophthalmic (1.30 P.M.), and the Central London Ophthalmic Hospitals operations are performed daily.

SOCIETIES.

- WEDNESDAY.**—OBSTETRICAL SOCIETY OF LONDON.—8 P.M. Specimens will be shown by Mr. Moran (for Dr. Lowe and Mr. Bradbury), Mr. Targett, and Dr. Blacker. Adjourned Discussion on Dr. Eden's paper on "The Development and Normal Structure of the Human Placenta." Papers:—Mr. Alban Dunning: Placental Polypus.—Dr. T. G. Stevens: Notes on the Variation in Height of the Fundus Uteri above the Symphysis during the Puerperium; the Conditions which influence this, and the Practical Conclusions which may be drawn from such observations.
- FRIDAY.**—OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM.—8.30 P.M. Card Specimens at 8 P.M.: Dr. E. H. Cartwright: Modification of Thompson's Test for Colour Vision. Papers:—Mr. Walter H. Jessop: Some cases of Graves' Disease with Destruction of Eyes.—Mr. Rayner D. Batten: The Connection between some cases of Myopia and Disease of the Nose and Pharynx. And other papers.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

- WEDNESDAY.**—NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC (Bloomsbury).—3 P.M. Lecture by Dr. Gowers.
- ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN (Leicester-sq., W.C.).**—5 to 6 P.M. Dr. Morgan Dockrell: Neuroses.
- SATURDAY.**—ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN (Leicester-sq., W.C.).—5 P.M. Dr. Morgan Dockrell: Exfoliative Dermatitis.

During the week marked copies of the following newspapers have been received:—*Walsal' Advertiser, Times of India, West London Observer, Birmingham Post, Pioneer Mail, Carlisle Patriot, Sussex Daily News, Cambrian, Cambridge Express, Grimsby News, Nottingham Guardian, Liverpool Mercury, Dundee Advertiser, Birmingham Gazette, Manchester Courier, Glasgow Daily, South Wales Daily News, Eastern Morning News, Market Harborough Advertiser, Walsley Mirror, East London Observer, Scotsman, Morning Post, Southampton Times, Builder, Macclesfield Courier, Sanitary Record, Evesham Journal, Worcester Herald, Worcester Daily Times, Galt's Daily News Letter (Jamaica), Brighton Gazette, City Press, Leeds Mercury, Hertfordshire Mercury, Liverpool Daily Post, West Middlesex Standard, Yorkshire Post, Local Government Chronicle, Bristol Mercury, Mining Journal, Weekly Free Press and Aberdeen Herald, Reading Mercury, Surrey Advertiser, Australasian Medical Gazette, Guy's Hospital Gazette, Local Government Journal, New Zealand Herald, Rangoon Gazette, Ripley Advertiser, Alton Herald, Kerry Sentinel, Athlone News, Daily Chronicle, Norfolk Standard, Isle of Ely Advertiser, Bewickshire News, Falkirk Herald, Harrogate Advertiser, Eastern Daily Press, Southern Echo, Lancington Spa Courier, Lloyd's, Batley News, &c., &c.*

Notes, Short Comments & Answers to Correspondents.

EDITORIAL NOTICE.

It is most important that communications relating to the Editorial business of THE LANCET should be addressed exclusively "TO THE EDITORS," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

Lectures, original articles, and reports should be written on one side only of the paper.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale and advertising departments of THE LANCET should be addressed "To the Manager."

We cannot undertake to return MSS. not used.

MANAGER'S NOTICE.

THE INDEX TO THE LANCET.

THE Index for the current half-year is given in this week's issue, which completes the first volume of the year 1895. The practice of supplying loose copies will be discontinued, the Index now being placed in the centre of the journal for the better convenience of subscribers.

"ALLEGED TOUTING BY A PUBLIC VACCINATOR."

IN our issues of May 18th and June 15th we commented upon statements reflecting on the mode of practice adopted by a public vaccinator, which, as represented, amounted briefly to "touting." This we said, and added that if the alleged touting were the fact then there had been a grave breach of professional etiquette. We have since received from both sides copies of the somewhat voluminous and acrimonious correspondence that has passed between them, upon which we are asked to adjudicate. Having perused these letters we are unable to modify our previous opinion, except to this extent—namely, that the public vaccinator seems to have acted under a mistaken sense of his duties, and therefore is hardly to be charged with intentional violation of ethical laws. The gentleman who complains that his patients were visited by the public vaccinator was perfectly justified in making his complaint. It would be intolerable if the system so complained of were the rule. The public vaccinator is only required to make domiciliary visits on persons residing at a distance of more than two miles from the vaccination station, and it is not his business, but that of the vaccinating officer, to see that those requiring public vaccination shall receive his services within the statutory period.

Dr. Gourley.—Our correspondent is thanked for sending us the letter. He is right in claiming a guinea for all insurance certificates, and whether the life be accepted or not. We demur entirely to the statements in the letter as to the custom of good offices. There should certainly be no difference as to the action of all good practitioners in refusing to do such work for less than a guinea.

WANTED, A MEDICAL HOME.

To the Editors of THE LANCET.

SIRS,—There are several institutions, I believe, in or near London which would give a home to poor gentlemen who can pay or have paid for them a weekly sum of 15s. or £1. Can any of your readers give me the address of one (or more) of these homes, and recommend any one as being a good and well-managed place of the kind?

I am, Sirs, yours very truly,

June 24th, 1895.

A. B. C.

POSTURAL TREATMENT OF INCONTINENCE OF URINE.

ACCORDING to Dr. J. Stumpf of Wernick, incontinence of urine in children may frequently be cured by a very simple mechanical, or rather postural, expedient. The child's pelvis is raised in bed so as to be at an angle of from 130° to 150° with the vertebral column as it rests horizontally, the head being on a thin pillow. By this arrangement the weight of the bladder as it fills is prevented from pressing upon the vesical orifice of the urethra, and so does not cause involuntary micturition. After about three weeks of this treatment the child may generally be allowed to resume the ordinary position in bed without fear of a return of the incontinence.

Rodney is advised to apply to the university at which he graduated. Full particulars of the examination for diplomas in State medicine will be found in our Students' Number, Sept. 1st, 1894, p. 542.

"THE TITLE OF 'DR.'"

To the Editors of THE LANCET.

SIRS,—The plth of the pain on this subject lies in the fact that the title of "Dr." at once removes its possessor from amongst the laity and announces professional rank, whilst the title of "Mr.," as applied to a surgeon and physician, carries no distinctive professional mark, and in this respect announces nothing. This is a profound practical grievance, and how much this distinctive mark is prized the following extraordinary example illustrates. Two "Mr.s" are in opposition in a country practice. The more recently established has "Dr." on his plate; the other, at a disadvantage, adheres to "physician and surgeon." All this disagreeableness we owe to that anomalous institution peculiar to the British Isles—"licensing bodies." In France every layman is "Monsieur," every medical man "Monsieur le Docteur." In France a man obtains a "licence" to keep a dog or to sell gin; but if he aspires to the practice of the healing art he must take the title of "Docteur." In Germany things are carried a step further. All duly qualified medical men are compelled to pass a State examination before being allowed to practise. This system possesses two high merits: it reassures the public as to the competency of the medical man, and it reduces all members of the profession to a grand equality. The introduction of a compulsory State examination, conferring the degree of Doctor of Medicine, would not only solve this bitter question of the title of "Dr.," but would probably also take the place of a second university for London. A body of examiners appointed by the State would hold examinations in three centres—London, Edinburgh, and Dublin. Such an examining body would occupy itself with two matters—a high standard of matriculation and a final examination for the diploma. A respectable standard of matriculation would be an examination corresponding with the B.A. of Oxford or Cambridge, and assuredly this is not too high a standard of liberal education for a professional man. The final examination would include the three great branches of the profession—surgery, medicine, midwifery—including the allied subjects of pathology, anatomy, physiology, materia medica, and diseases of women and children. To this diploma could be devoted that iniquitous extortion, the £5 paid by duly qualified men for mere registration. Any man passed by such a body would be deservedly styled "Doctor of Medicine."

I am, Sirs, your obedient servant,

Ulverston, June 24th, 1895.

M. H. PERRY

To the Editors of THE LANCET.

SIRS,—It is not a little difficult to understand the position which THE LANCET takes up on this vexed question. You accord, you say, the title of "Dr." to the M.B. because it would be discourteous to refuse him a title which is his by courtesy. A very admirable sentiment. But it has been, time out of mind, the custom to ascribe by courtesy the title of "Dr." to all physicians. Is it not, then, discourteous in you to withhold it from those many members of the profession who are physicians by diploma, not by degree? But, further, if it is, as you yourselves say, discourteous to refuse a title of courtesy, what is it to refuse a title of right? Now, the L.S.A. is by right entitled to style himself "Dr." THE LANCET ignores his right and refuses him his title. The attempt to restrict the title to the M.B. and M.D., in, while the humble L.S.A. possesses this inconvenient right, on the face of it, an unfair and disingenuous one, and must necessarily fail. It seems to my humble capacity the merest common-sense to say that if X. is a doctor, not only the most courteous, but also the most accurate, description of him is "Dr. X." If a patient of mine may say to his wife, "Send for the doctor," why in the world is he not to say to me when I arrive, "Good morning, Doctor?" THE LANCET would pass the accusative but not the vocative case.

I am, Sirs, yours faithfully,

June 24th, 1895.

NOR L.S.A.

SOME QUERIES AND THEIR ANSWERS AND THE RESULT.

To the Editors of THE LANCET.

SIRS,—I have only just been favoured with a unique document which has recently been going the rounds here. It purports to be a copy of the correspondence and queries which were submitted by "Dubitator" to the Editors of THE LANCET re medical qualifications, together with the replies of the latter thereto. This correspondence has, I understand, appeared in the issue of THE LANCET of

May 11th, 1895. As the identity of "Dubitator" is well known to me I have inwardly chuckled at the characteristic canny manner in which he has managed to draw the editors. "The gentlemen desirous of entering the profession," in whose behalf "Dubitator" seems so much interested, is of course *non est*. If, however, such an entity exists, I only trust, for the sake of the profession, that he does not belong to "Dubitator's" family, as in my opinion one "genius" of that ilk is quite enough at a time. Dealing with the queries *seriatim*, "Dubitator" lays great stress on the "tone and character" which the possession of a university degree must necessarily confer, but if the "tone and character" of this university gentleman are to be measured by his code of medical ethics, then I blush for his *alma mater*. Fancy, Sirs, this gentleman with the "tone and character" offering his services gratuitously to patients who, to his certain knowledge, were actually at the time under the care of the "mere licentiate." This designation is, I believe, yours. With reference to the second query submitted, "Dubitator" includes the broad domain of Great Britain, as if anybody ever thought of comparing for a moment the "M.D. of Aberdeen" with that obtained at the University of London, &c. It is a notorious fact that the possessors of third- or fourth-rate university degrees give more trouble about their status *rel* "tone and character" than those possessing the higher university degrees. The latter, of course, have no need of tinselling. If "Dubitator" only affixes to his M.D. the name of the northern town from which it emanates the public will be able to gauge the relative value attaching to the doctorate. Is it not an indisputable fact that until quite recently the doctorate could be obtained by those possessing a little money and no brains, by simply purchasing a return ticket and availing themselves of a northern train? It is, moreover, exceedingly strange that the plucked of Dublin almost invariably succeed beyond the border, and this "is heard not alone in Ireland," but the writer has heard it in England, America, and on the Continent. The question at issue is briefly this. You state that a university degree has some advantage over a "mere licence." Will you undertake to say whether the degree of M.D. obtained at Aberdeen some twenty years ago implies a higher standard of medical education or knowledge than that required for the diplomas of the Conjoint Board of the Royal College of Physicians and Surgeons of Ireland? An early insertion will oblige.

I am, Sirs, yours faithfully,

June 16th, 1895.

VERAX.

. We must point out to our correspondent how absolutely impossible it is that we should know the motives which lie behind the numerous written queries with which we are honoured, and which we endeavour to answer to the best of our ability.—ED. L.

A CASE FOR SUGGESTIONS.

To the Editors of THE LANCET.

SIRS,—Would any of your readers offer a few suggestions on the following case? A man thirty-eight years of age had a brawl in a public-house; he was turned out with his opponent, and received from him a blow on the head; he fell and died in from a quarter to half an hour. Post mortem a slight contusion was found over the right eyebrow and a slight abrasion on the left ear; there was no fracture; the bones of the skull, especially in the temporal region, were abnormally thick. The surface of the brain presented a somewhat hyperemic appearance, but there was no sign of contusion of brain surface in the area corresponding to the external marks referred to above. A clot was found on the anterior surface of the medulla, and the clot was found to extend through the fourth, the third, and into the right lateral ventricle. The brain substance in the region of the right nucleus caudatus was torn up, evidently from the rupture of an artery in that situation; neither kidneys nor heart presented any pathological appearances to the naked eye, and the urine contained neither sugar nor albumen; there was no dislocation of the odontoid process or of the cervical vertebrae.—I am, Sirs, yours faithfully,

June 19th, 1895.

M.D.

S. J. M.—There is no way of gauging the comparative prestige of the medical degrees of the different universities in the different divisions of the Kingdom, but the particular degree mentioned by our correspondent is an excellent one, not to be obtained without the passing of examinations of reasonable severity, and entitling its holder to be well thought of by his professional brethren.

B. L.—To our knowledge the case has not been reopened from our correspondent's point of view.

"THE INFLUENCE OF THE ADMINISTRATION OF CHLOROFORM UPON THE COURSE OF PHTHISIS PULMONALIS."

To the Editors of THE LANCET.

SIRS,—In reference to Dr. Lee's communication in THE LANCET of June 15th, I also have noticed good results following chloroform in phthisis and in cases apart from operation, in which, of course, there is room for a fallacy to creep in. In one case the evening rise of temperature disappeared for eight or ten days after each administration. Moreover, I have so often found high fever decline after its use in non-surgical cases that I have resolved to try it in any case of hyperpyrexia that becomes intractable—pulse permitting.

I am, Sirs, yours truly,

Clun, Salop, June 19th.

H. CUTBERT.

THE ANTITOXIN SUPPLY OF THE HOSPITALS OF THE METROPOLITAN ASYLUMS BOARD.

In a leading article last week we alluded to the kindness of the Council of the British Institute of Preventive Medicine in the supply of antitoxin, as mentioned by Dr. Goodall in his interesting report. We should have supplemented this allusion by saying that in December last the managers accepted the offer of the Laboratories Committee of the Royal Colleges of Physicians of London and Surgeons of England to supply the same in sufficient quantities and of pure quality.

H. A. B.—1. There is no ground for the statement that there is any illegality in a medical man undertaking the duty.—2. Much modern brain surgery has been learned from experiments on living animals. For further information apply to the Honorary Secretary of the Association for the Advance of Medicine by Research, 57, Wimpole-street, W.

Fas.—1. Relationship to a student of medicine, however advanced, can give no claim to abatement of medical charges; but the point might be taken into consideration in conjunction with other circumstances.—2. The consultations should be charged for at the full fee.

Rustic.—There is no such institution.

"STAMMERING."

To the Editors of THE LANCET.

SIRS,—May I, in reply to Mr. Van Praagh, state that Mr. Behnke had seen no work on stammering when he devised the exercise termed by your correspondent "vocalising of sounds"? At the frequent earnest entreaty of a well-known Member of Parliament, who was his pupil for voice-use in public speaking, and who stammered, Mr. Behnke tried, and with success, to rid him of his speech trouble. Observing that he never stammered while singing, Mr. Behnke came to the obvious conclusion that this fact furnished the key to a system for training to coordination the various sets of muscles concerned in speech production. Subsequent study, aided by an ever-increasing experience, led him to recognise that there is no universal panacea for the cure of speech disorders, and that while the broad principles remain the same each case presents its own idiosyncrasies, which must be carefully recognised and treated on their merits. As my husband and I studied and worked together for nearly twenty-five years, and as I was also his secretary, I am able to vouch for the accuracy of my statements. In conclusion, it is a well-known fact that the same idea occurs to persons entirely independent of and widely separated from each other, as inventors know to their chagrin; but this does not make the idea any the less original in either case.

I am, Sirs, yours obediently,

June 24th, 1895.

K. BEHNKE.

. This correspondence must now cease.—ED. L.

A QUESTION OF ETIQUETTE.

To the Editors of THE LANCET.

SIRS,—A. is acting as locum tenens for a practitioner, and is called to see a girl one night about 6 o'clock. He saw her and prescribed for her. At 9 o'clock the next morning he received a letter from the patient's father, saying that she had been much worse through the night, and that early in the morning he had fetched B., another practitioner, who saw her by himself. The father says he has no fault to find with A., but "one has more confidence in a doctor one knows," and adds, "B. is coming to see her again to-day at 12 o'clock, and would like to have met A.; but I think I would like B. to take charge of the case. However, I have no objection to A. coming back again."

1. What course should A. follow? 2. Has B. acted professionally?

I am, Sirs, yours faithfully,

June 25th, 1895.

X. Y. Z.

. A. should meet B. and decide with him amicably the course to be pursued. B. showed the proper spirit in desiring to meet A. We cannot comment on the fact that upon the first occasion of being sent for B. saw the patient by himself, because insufficient details are before us. Was the case urgent, for instance? Or was B. told that the patient was already being treated by another practitioner before he reached the house?—ED. L.

A BOOK ON TOBACCO.

To the Editors of THE LANCET.

SIRS,—I should like to get some information as to a certain book on tobacco. I have been told that there exists no book in the world that treats of the effects of nicotine. I am, however, under the impression that I saw in England a book written by an eminent English medical man, in which the effects of the abuse of tobacco and poisoning by nicotine are dealt with. Perhaps some of your readers can give me the name of the author or publisher of this book, or inform me if such a book exists.

I am, Sirs, your obedient servant,

Karlshad, May 7th, 1895.

LUDWIG KOHN.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

Communications, Letters &c. have been received from—

- A.**—Dr. McC. Anderson, Glasgow; Miss E. E. Adams, Lond.; Anglo-Swiss Condensed Milk Co., Lond.

VAN HOUTEN'S

PURE SOLUBLE

C O C O A.

BEST & GOES FARTHEST.

*By VAN HOUTEN'S Special Process
of manufacture—*

1. The excess of fat is removed and the other valuable constituents are increased, including the Albuminoids, the Theobromine, and the Phosphates.
2. The natural flavour and aroma are fully developed.
3. The solubility is greatly increased.
4. The tissues of the bean are softened and, with the fat or cocoa butter, rendered digestible and assimilable.

**"VAN HOUTEN'S COCOA has formed the subject of special
analysis by some of the greatest European chemists, and all
concur in regarding it as a perfect beverage combining
STRENGTH, PURITY, and SOLUBILITY."**—MEDICAL ANNUAL

MACMILLAN & CO., LONDON.

NEW EDITION OF MARSHALL & HURST'S "PRACTICAL ZOOLOGY."

Just Published, FOURTH EDITION, Revised by C. HERBERT HURST. With Illustrations, crown 8vo, 10s. 6d.

A JUNIOR COURSE OF PRACTICAL ZOOLOGY.

By the late A. MILNES MARSHALL, M.D., D.Sc., M.A., F.R.S.,

Professor in the Victoria University; Beyer Professor of Zoology in Owens College; late Fellow of St. John's College, Cambridge;

Assisted by C. HERBERT HURST, Ph.D.,

Lecturer in the Victoria University; Demonstrator and Assistant Lecturer in Zoology, Owens College, Manchester.

London: SMITH, ELDER, & CO., 15, Waterloo-place.

Just published, price 5s.

SPINAL CARIES.

(SPONDYLITIS OR INFLAMMATORY DISEASE OF THE SPINAL COLUMN.)

With 88 Illustrations

By NOBLE SMITH,

Surgeon to the City Orthopaedic Hospital; Surgeon to All Saints' Children's Hospital.

"This monograph records in a practical manner the result of the author's experience. A special feature in the work is the accuracy and care with which the illustrations have been produced, by means of which different forms of spinal caries and the etiology of the disease are well demonstrated. The author's directions regarding the treatment of inflammatory disease of the spinal column are given with much clearness."—THE LANCET.

"A useful contribution on a difficult subject. . . . thoroughly practical. . . . The drawings are numerous and good."—THE MEDICAL TIMES AND HOSPITAL GAZETTE.

London: Smith, Elder, & Co., 15, Waterloo-place.

Fifth Edition, with Coloured Plates, price 12s. 6d.

DISEASES OF THE EAR,

By GEORGE P. FIELD, M.R.C.S.,

Aural Surgeon to St. Mary's Hospital and Dean of the Medical School.

"Very practical and helpful."—THE LANCET.

"It contains a novel feature. A number of plates are given on thick cardboard, the spot where the membrana tympani ought to be seen is perforated, and a coloured representation of the drum is pasted on behind. If the membrana be looked at through a speculum a more correct idea than any heretofore given will be the result."—MEDICAL TIMES AND GAZETTE.

"Forms an excellent guide for the practitioner or the student."—BRITISH MEDICAL JOURNAL.

"It is a practical treatise founded on vast clinical experience. The illustrations are excellent and helpful, the text is clear and concise, and the work as a whole is as complete and trustworthy as we could desire. We recommend it strongly to practitioners and students alike."—MEDICAL PRESS AND CIRCULAR.

"The fourth edition of this book was sold out in eight months."—FROM PREFACE.

London: Baillière, Tindall, & Cox, King William-street, Strand.

A TREATISE ON RUPTURES.

By J. F. C. H. MACREADY, F.R.C.S.,

Surgeon to the City of London Truss Society, the Great Northern Hospital, the City of London Hospital for Diseases of the Chest, &c.

With numerous Illustrations and 24 Plates. Large 8vo, 25s.

"We regard this treatise as MUCH the MOST IMPORTANT work on Hernia which has appeared in this country of late years."—GLASGOW MED. JOUR.

"There can be no hesitation in saying that this is the BEST WORK on Hernia extant in the English language."—INDIAN MEDICAL GAZETTE.

London: Charles Griffin & Co., Ltd., Exeter-street, Strand.

By Dr. George Harley, F.R.S.

Diseases of the Liver, with and without

Jaundice. 3 Illustrations. . . . price 21 s. 6

"A storehouse of practical information."—CANAD. PRACT.

"The subjects dealt with are marvellously great."—MED. TIMES.

"No book can be advantageously compared to it."—JOURN. DE MÈD.

"Most excellent and thoroughly practical."—EDIN. MED. JOURN.

"The best authority on the liver that can be found."—MED. REPERT.

"For originality of thought and diagnostic sagacity this work stands unexampled."—AUSTR. MED. GAZ.

J. & A. Churchill, 11, New Burlington-street, W.

Now Ready, 3rd Edition, cloth gilt, cr. 8vo, with 5 Coloured Plates, 2s. 6d.

ON PERINÆORRHAPHY BY FLAP-SPLITTING.

By FANCOURT BARNES, M.D., F.R.S.E.,

Consulting Physician to the British Lying-in Hospital.

"Dr. Fancourt Barnes has succeeded in enriching this publication with illustrations far more instructive than those found under the heading of Perinæorrhaphy in most text-books."—BRIT. MED. JOUR.

"No obstetric practitioner should fail to read this little monograph."—THE INDIAN MEDICAL RECORD.

J. BALE & SONS, 85-89, Great Titchfield-st., Oxford-st., London, W.

THE ROUTE INDICATOR.

(Easily detachable so as to be capable of being used for several Carriages.)

CAN BE OBTAINED AND FIXED BY ANY COACH-BUILDER.

Consists of two dial plates with movable pointers, regulated by a spring and a bell. One plate is affixed in some convenient part of the carriage in front of the driver.

When the occupant of a carriage desires to direct the driver, a handle or knob to the dial in the interior of the carriage is moved until the pointer indicates the direction required, when, simultaneously, the bell on the exterior instrument rings and the pointer moves to the indication corresponding to that of the dial in the interior of the carriage, and by the aid of a spring it is secured in any desired position.

ADVANCE NOTES.

LADY'S PICTORIAL:

"Much needed in the equipment of carriages."

LAND & WATER:

"At a reasonable price it is sure to catch on."

THE ROAD:

"A remarkably ingenious and useful invention."

INVENTION:

"A slightly fitting to any vehicle."

TO-DAY:

"No more will cabby drive us gaily past our doors."

RAILWAY SUPPLIES JOURNAL:

"For ladies shopping and visiting, FOR DOCTORS & OTHER PROFESSIONAL MEN, for commercial travellers making their city rounds, to say nothing of the general public who make use of hansoms and similar vehicles, it must be an immense advantage."

The Instructions or Directions on the Dials can be modified according to requirements for **SIGNALLING ORDERS TO DRIVERS OF BROUGHAMS, HANSOMS, & OTHER VEHICLES.**

MEDICINE TIME INDICATOR, & POISON PREVENTIVE.

Patented by J. FEAVER,
 22, Croydon Road, Anerley, S.E.

THIS invention is a device for use upon or in connection with Medicine Bottles, for indicating or recording the time at which the last dose was taken, or the time when the next dose should be given. It also serves to distinguish medicine bottles from others containing poisons or preparations not intended to be taken. The label or tablet is gummed or attached to, or suspended from the bottle, or it may be placed in any convenient position in the patient's room if administered. This device is valuable for medicine for internal use only is being administered. This device is valuable for family use, by nurses in hospitals, for travellers, or in places where several sick persons need medicine, or for general use by doctors or chemists. I also make other shapes and devices of various sorts of material also for securing the above purposes for pill boxes, &c., as well as for bottles.

NEW AND SECONDHAND SURGICAL INSTRUMENTS, OF EVERY DESCRIPTION, AT GREATLY REDUCED PRICES. OSTEOLOGY & MICROSCOPES.

ANTI-DIPHThERITIC SERUM EXSICCAT. (B. W. & CO.) IN SCALES.

Having been the first to produce successfully Anti-Diphtheritic Serum of full potency in a dried form, we have pleasure in drawing attention to its advantages:- (1) Its keeping properties are guaranteed; (2) it is perfectly sterilised; (3) its greater convenience is self-evident; (4) it is easily and perfectly soluble in water at normal temperature, 1 gramme dissolving in 5 c.c. of water.

This serum is supplied in 1-gramme tubes, hermetically sealed, at 1/- per tube, each gramme being equal to 10 c.c. of the normal liquid Anti-Diphtheritic Serum, which we supply in 30 c.c. phials as usual at 1/- per phial. We shall be pleased to send our pamphlet dealing with these serums, and the practical points in connection with the new treatment, to any Medical Practitioner on request.

NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of the forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, TO INCREASE THE NERVE CAPITAL OF YOUR PATIENT.

DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity *when* its supplying nerve is disordered *by lowered tone*, but this fact is largely ignored in these modern pepsin days—the *cause* being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of the *neurotic* patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are *two distinct* INDICATIONS, one is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of CELERINA in all dyspeptic troubles.

RIO CHEMICAL CO., St. Louis, Mo., U. S. A.

The above Preparation is prepared exclusively for the prescriptions of Medical Men. A sample will be sent free to any Medical Man who desires to test it, on application to

ELASTIC STOCKINGS.

For DELICATE PATIENTS.

BAILEY'S

"COURT" & "DRESS"

**Silk Elastic
Stockings.**

The Finest that can be Woven.

British Medical Association,
NOTTINGHAM, 1892.

"Messrs. BAILEY exhibited some Silk and Cotton Elastic Stockings of a surprisingly fine texture, hardly to be distinguished from ordinary fine hose, and yet affording efficient support. Undoubtedly they could be worn with the minimum of inconvenience." A badly-fitting stocking, or one made of unsuitable material, is not only no good, it is positively harmful.

COTTON ELASTIC STOCKINGS supplied to Hospitals and Poor Patients at lowest possible prices.

For Measurement send circumferences at the letters, and the length.

HIGH-CLASS PHARMACEUTICAL PREPARATIONS.

SAVARESSE'S CAPSULES.

NOT MADE OF GELATINE.

Being made of MEMBRANE they are free from the objections to all Gelatine Capsules.

What is the best way to give Sandal Wood Oil or Copaiba? They should be *pure*, and act near the disease without nausea or stomach disturbance.

SAVARESSE'S Capsules of organic membrane answer these requirements; they do not dissolve in the stomach (avoiding nausea and irritation), but generally in the intestines.

Mr. W. Acton, F.R.C.S. (p. 96, "Urinary Diseases"), recommended them.

They are increasing in favour with Medical Men who want *sure* results. Sandal Wood Oil, 4/6; Copaiba, 2/6 boxes.

EVANS' FLUID EXTRACTS.

The Perfection of Pharmacy. Made with special menstrua, they represent weight for weight of the crude drug, of which they contain the *whole* of the medicinal properties. Always reliable; keep well. Tinctures and infusions can be immediately prepared from them, one minim representing one grain of the drug. Full List, with Doses, &c., on application.

True Lime Fruit Juice is a very useful acid drink, when diluted. The best is from the Consignee's Estate in Montserrat, W.I., of which over 100,000 gallons annually come over to the Sole Consignees. It is pure, reliable, pleasant, and a genuine anti-scorbutic. Imperial Pints and Quarts.

Lescher's Recent *Materia Medica*, 4th Edition, 500 Drugs, with Doses, Formulæ, &c., 2/6.

ALL ABOVE MAY BE PROCURED THROUGH USUAL TRADE CHANNELS.

EVANS, LESCHER, & WEBB,
60, Bartholomew Close, London. Paris & Sydney Agencies.

PRESCRIBE

CASCARA-HAWLEY

FOR

CONSTIPATION.

A reliable Laxative is often wanted (especially for Ladies and Children), tasteless, and that can be swallowed with ease. Nothing can be better than the B.P. fl. Extract of Cascara Sagrada, rendered tasteless by an envelope or gelatine. A capsule is equal to 1/2-drachm of fl. Extract. In Pregnancy and Habitual Constipation invaluable. 1/1½ and 4/6 boxes.

SAVAR'S Cubeb Cigarettes.

Is there any real palliative for Asthma and Chronic Cough? Cubeb smoked so as to get the effect of the resins down the throat are always worth a trial. Here the effect is aided by Stramonium and softened by Cannabis Indica. To be smoked through the Nose for Hay Fever. 1/- and 2/6 boxes.

SAVAR'S COCA WINE.

WHAT COCA WINE SHALL WE ORDER? SAVAR's, brought out in 1875, is standardised to contain 1/4-grain pure Cocaine in each fl. oz., and 2 fl. drachms are a dose. Many Coca Wines cannot be sold by Chemists without a wine licence, because so weak in Cocaine—SAVAR'S can. Physicians know exactly what they are doing in ordering this stimulating tonic. Bottles 4/- and 7/-.

SCOTT'S EMULSION

Is Manifestly The Standard Emulsion of Cod Liver Oil.

We say "manifestly" because it has more generally the indorsement of the medical fraternity than has any other preparation of cod liver oil.

Physicians have found by personal observation that it is a reliable emulsion—probably Scott's Emulsion is prescribed more often than all other forms of cod liver oil combined.

To tell physicians who have prescribed it why this is so, is unnecessary—to those who have never given it a test, we shall be pleased to deliver a sample free.

FORMULA: 50% of the finest Norwegian Cod Liver Oil; 6 grs. Hypophosphite of Lime; 3 grs. Hypophosphite of Soda to the fluid ounce.

PULVIS JACOBI VER., NEWBERY.

The attention of Practitioners is invited to this invaluable adjunct to the treatment of **INFLUENZAL COLD, FEVER, &c.**

Sir JAMES MURRAY, M.D., wrote as follows :—

"Eaton Square, London,
"January, 1890.

"Messrs. F. Newbery & Sons.

"Dear Sirs,

"..... I was asked to see a lady, aged seventy, suffering severely from pains and red joints, acute pain of head, intolerance of light, hot dry skin, and restlessness. She had tried various diaphoretics, which caused sickness and nervous spasms.

"I recommended equal parts of your true James's Powder and the extract of Hyoscyamus, to be used till softness of skin and sleep should ensue. These effects followed the next night, whilst fever abated and the patient rapidly recovered.

"Yours, dear Sirs, truly,
(Signed) "J. MURRAY, M.D."

"ALEXANDER TWEEDIE, M.D., Physician to the London Fever Hospital (admittedly one of the highest practical authorities on the subject of Fever) in his "Lumleian Lecture" on Fever, which appeared in THE LANCET, 1859, stated the term he used when prescribing Dr. James's Powder "Prepared by Newbery."

In his work on "The Diseases of Women," ALFRED MCCLINTOCK, M.D., M.R.I.A., late Master of the Lying-in Hospital, Dublin, at page 20, states :—

"As auxiliaries to bleeding, linseed-meal poultices, or warm fomentations may be applied over the lower belly; and small doses of Plummer's pill, or blue pill, with James's Powder (Newbery's), should be administered."

At page 389 :—

"On the second day she had a rigor, followed by rapid pulse and hot skin, and a dry brown tongue, but no uterine pains or tenderness. She was ordered large doses of James's Powder (Newbery's, what I always prescribe), four ounces of brandy in the day, and the poultices to the belly. On the third day the pulse was 100, and on the fifth day it had fallen to 88. She was quite well, and able to go home on her ninth day."

Sample for trial in Practice free to any Member of the Medical Profession on request.

Post free per Bottle, 3s. 4d. or 9s.

Notice to the Medical Profession.

BENGER'S FOOD is *not* predigested—as appears to be erroneously supposed by some medical men. It consists of a highly nitrogenous wheaten meal, cooked and impregnated with a suitable proportion of the natural digestive principles of the pancreas. When mixed with warm milk, according to the directions on each tin, these principles convert the farinaceous elements of the food into soluble dextrines and sugar; they further modify, but do not fully peptonise the casein of the cow's milk. This modified casein forms small flocculent curds, instead of hard indigestible masses, in the stomach of the infant, the condition of the casein resembling that of human milk. The fat is entirely unaffected. In this way the digestive organs of the infant are merely relieved of the excessive strain placed on them by the ingestion of ordinary Foods, whilst there is abundant work left to ensure their proper development.

The practical experience of those medical men who prescribe it, and of thousands of mothers, has proved that not only does the infant thrive on Benger's Food almost, or quite, from birth, but that when the time comes for the gradual substitution of other aliment the digestive organs, instead of being weak and atrophied, are healthy and vigorous, and much better able to perform their functions than those of children whose stomachs have been kept in an irritable condition by unsuitable food.

MEDICAL OPINIONS.

"Mr. Benger's admirable preparations."—THE LANCET, March 25th, 1882.

"Deserving of the highest praise, and only require to be made known to the profession to ensure their extensive employment."—THE PRACTITIONER, February, 1883.

"Few modern improvements in Pharmacy have done so much as Benger's Preparations to assist the Physician in his treatment of the sick."—THE MEDICAL PRESS, June 13th, 1883.

"Benger's Preparations have deservedly a very high reputation and are all largely used."—THE MEDICAL TIMES AND GAZETTE, September 8th, 1883.

"Benger's Food is a preparation, devised on original lines, and which we can speak of in the highest terms. Infants do remarkably well on it, and it is most suitable for many conditions in adults and old people. There is certainly a great future before it."—THE ILLUSTRATED MEDICAL NEWS, December 22nd, 1888.

"Undoubtedly a great advance on any previous attempt in this direction. It is palatable and excellent in every way. We have given it in very many cases with the most marked benefit, patients frequently retaining it after every other food has been rejected. For children who throw up their food in curdled masses it is invaluable."—THE LONDON MEDICAL RECORD, March 15th, 1882.

BENGER'S FOOD may be obtained in Tins of leading Chemists, &c. everywhere; wholesale of all wholesale houses, or of

PEPTONIZED MILK

(PATENT CONCENTRATED).

The remarkable value of Peptonized (*predigested*) Milk has now been completely established. Without calling for any digestive effort, it can, in the absence of all other food, supply the system for an indefinite period with the nutriment which it requires. The great drawback to the more extended use of Peptonized Milk has been the trouble, care, and even skill required to be daily expended to prepare a fairly palatable and uniformly peptonized product. These disadvantages are entirely obviated by the use of this Concentrated Preparation, as by mere dilution with water a deliciously-sweetened Peptonized Milk, of uniform composition, can be instantly prepared by the most inexperienced person.

In Tins, 2s. 6d.; in Half-Tins (Samples), 1s. 6d.

PEPTONIZED COCOA AND MILK

(PATENT CONCENTRATED).

In this preparation the Cocoa as well as the Milk is peptonized and rendered soluble, and is therefore more readily assimilable than any other preparation of Cocoa extant, and can be digested by even the most confirmed dyspeptic. Besides its extreme digestibility, its perfect palatableness renders it a most delicious as well as wholesome beverage, which can be taken alike by the invalid and by those who, although otherwise healthy and robust, frequently experience a difficulty in digesting any form of Cocoa. For general convenience in use it is unrivalled, as no addition of milk or sugar is needed, but only mixture with hot water.

Tins, 2s. 6d., to make fifteen breakfast cups of Cocoa, or ten or more breakfast cups of rich Chocolate. Also in Half-Tins (Samples), 1s. 6d. each.

N.B.—The milk used in these preparations is secured from farms under our control, and where the sanitary arrangements have been made perfect, and, in addition to this, sterilisation after the most approved modern methods is provided for, thus ensuring complete immunity from communication of the infectious diseases which are unhappily so often spread by means of milk.

OPINIONS OF THE MEDICAL PRESS.

THE LANCET, June 15th, 1889:—

"Peptonized Milk (Patent Concentrated) is an excellent article. In consistence it is like a thick cream, agreeable in flavour, and yet so well peptonized that it gives no coagulation with dilute hydrochloric acid, even after heating. It will be of great value. The Peptonized Cocoa and Milk (Patent Concentrated) is clearly founded on the above. In appearance it resembles chocolate cream, and it is delicate in flavour, and yet peptonized. It is almost needless to say of Messrs. Savory & Moore's novelties that they are well prepared."

THE PRACTITIONER, July, 1889:—

"We have carefully examined and tested Savory & Moore's Peptonized Cocoa and Milk and Peptonized Milk, and have used them ourselves and for patients of fastidious appetite. We find them well peptonized, capable of keeping even when the tins are opened for a considerable time, and very palatable. The Cocoa and Milk forms a thin and inviting beverage of a pleasant nutty flavour, and is retained well even in cases of chronic neurotic vomiting. The Peptonized Milk mixes well with tea or coffee, and improves the taste of both. These properties render Messrs. Savory & Moore's latest preparations a valuable addition to the sick-room dietary, and we can recommend them to the profession."

THE MEDICAL PRESS AND CIRCULAR, Sept. 4th, 1889:—

"The Peptonized Cocoa and Milk and Peptonized Milk introduced to our notice by Messrs. Savory & Moore, like everything emanating from their laboratory, are most carefully prepared and of the highest quality. There is, moreover, a delicacy in flavour and aroma with the Peptonized Cocoa which shows at once that the products of selected growths only obtain a place here. It is, therefore, one we can unhesitatingly recommend."

N.B.—THESE PREPARATIONS KEEP WELL AFTER THE TINS ARE OPENED.

SAVORY & MOORE,

Chemists to the Queen, H.R.H. the Prince of Wales, H.H. the Khedive of Egypt, &c.

143, NEW BOND STREET, LONDON.

SAVORY & MOORE'S BEST FOOD FOR INFANTS.

*The attention of the Medical Profession is especially requested to the following characteristics of this old-established **SELF-DIGESTING** Food, which has so thoroughly maintained its reputation for superiority during an experience of 30 years:—*

- | | |
|--|---|
| Ratio of Albuminoids to carbohydrates. | The ratio of the albuminoids to the carbohydrates is the same as in human milk—viz., 1 to 6·4; the ratio in cow's milk being only 1 to 3·8. |
| Albuminoids easy of digestion, not pre-digested. | The albuminoids are not predigested as in pancreatised foods, but are rendered easy of digestion, leaving (as in human milk) just sufficient work to strengthen and develop the immature digestive powers, instead of weakening and abrogating them by keeping them inactive. Sir WILLIAM ROBERTS' experiments in feeding kittens show that distinct failure of nutrition occurs when the milk is predigested (peptonised), and the same thing has been observed in feeding infants, probably owing, as THE LANCET points out, to atrophy of unemployed glands. |
| Healthy nature of evacuations. | As a consequence of the foregoing the proper peristaltic action of the bowels is maintained, and the healthy nature of the evacuations of infants fed on this food is a satisfactory feature much and favourably commented on by Mothers and Nurses. |
| The curdling of Cow's milk prevented. | When mixed with cow's milk it prevents the troublesome curdling in the stomach which takes place when cow's milk is given alone, and assimilates its composition to that of human milk. |
| Complete conversion of the starch. | The active Malt Diastase present provides for the rapid and complete conversion of the starch at the time of mixing into the soluble assimilable products of maltose and dextrine. The point of the gelatinisation (thickening) of the Food—viz., 140° F.—is just that at which Malt Diastase is most active, and the conversion of the starch is consequently the work of a very few minutes only. |
| Retention of the Phosphates and Fat. | The retention of the fat and of the phosphates of the wheat and malt, which are so essential to bone formation. These exist chiefly in the outer portions of the grain, the very parts which some manufacturers pride themselves upon so successfully rejecting. |
| Absence of Fermentable sugar. | The absence of the fermentable sugar, which in the various malt extracts and milk foods so often gives rise to Diarrhoea and Flatulence. |
| Verdict of Jury as to inferiority of imitations. | It is the <i>only</i> Infants' Malted Food which obtained a Gold Medal at the International Health Exhibition, the Jury being comprised of such authorities as Dr. ATTFIELD, F.R.S.; G. W. WIGNER, F.I.C., the then President of the Society of Public Analysts; Dr. JAMES BELL, F.R.S., the Head of the Government Laboratories; and other distinguished Medical and English and Foreign Experts. This affords significant indication of the value to be attached to the numerous imitations, which, whilst pirating the descriptive notices of the Food, utterly fail to approach its standard of excellence. |

SAVORY & MOORE,
143, NEW BOND STREET, LONDON, W.

CHLOROFORM.

Chloroform (DUNCAN'S S.G. 1490) Non-decomposable.

This contains about 1 per cent. Absolute Alcohol, but in other respects is identical with our ordinary make (S.G. 1497). While this minute proportion of Alcohol in no way affects anæsthetic power, it renders the Chloroform **PRACTICALLY NON-DECOMPOSABLE.**

GELATINE CAPSULES, 1000 Varieties.

**CASCARA CAPSULES. EASTON'S SYRUP CAPSULES.
GREGORY'S POWDER CAPSULES.**

BLAUD'S PILL CAPSULES.

GUARANTEED STRENGTH.

At the request of medical men and others we have analysed a number of **BLAUD'S PILL CAPSULES** similar in size and colour to those of our own make. These capsules were stated to be each equal to three Bland's Pills, but our analyses showed that in no instance were they equal to more than $1\frac{1}{2}$ Bland's Pills. This is neither fair to the medical man nor to his patient.

WE GUARANTEE OUR ONE, TWO, AND THREE PILL CAPSULES TO BE EQUAL RESPECTIVELY IN FERROUS CARBONATE TO ONE, TWO, AND THREE FRESHLY-PREPARED BLAUD'S PILLS. THEY HAVE ALSO THIS DISTINCT ADVANTAGE OVER PILLS, THAT THEY NEITHER OXIDISE NOR HARDEN.

DUNCAN'S SYRUP ^{of the} HYPOPHOSPHITES.

STABLE.

ELEGANT.

RELIABLE.

Manufacturing Chemists, EDINBURGH.**

The above may be ordered through any Wholesale or Retail Druggist. The Capsules and Syrup are sold and dispensed by
Messrs. ROBERTS & CO., 76, New Bond Street, LONDON, W.
Wholesale from WM. EDWARDS & SON, 157, Queen Victoria Street, London, E.C.

CLEANLY, ACTIVE, AND EFFICIENT PREPARATIONS OF THE THYROID GLAND.

Myxœdema.

THE histories of Cretinism and Myxœdema, which have recently received so much attention at the hands of leading specialists, point to the conclusion that the profound changes affecting the whole body are associated with an absence, or atrophy, of the Thyroid Gland.

The continued success attending the new line of treatment in Myxœdema and allied diseases by Extract of Thyroid Gland will doubtless further extend the uses of this valuable therapeutic agent. Since 1891 a sufficient number of patients have been to all appearances so restored to health that it is allowable to believe that they can hardly relapse again.

Sporadic Cretinism.

To illustrate well the vast improvement, both physical and mental, which this form of treatment induces in sporadic cretinism, we cannot do better than refer the reader to an original article which appeared in *THE LANCET*, with Photographs by W. W. O—, M.D.Oxon., M.R.C.P.Lond., Nov. 4th, 1893, p. 1113.

All these cases were treated by Allen & Hanburys' Thyroidin Tabellæ. The results are perhaps more remarkable than those obtained in the allied condition of Myxœdema. The writer observes that these preparations have given entire satisfaction. The Photographs speak for themselves.

Whilst formerly liquid extracts and the raw gland were used, ALLEN & HANBURY'S were the first to offer the active principles of the thyroid gland in the compressed form, which is now the favourite mode of administration, and their preparations of Thyroidin were introduced to the medical profession in the advertising columns of *THE LANCET* on February 25th, 1893. Careful study and subsequent experience in the mode of preparation, under the guidance and direction of some of the leading members

of the medical profession, have enabled them to produce Thyroidin—i.e., the active principles isolated from carefully selected glands. The glands are dissected and carefully examined and separated from all blood, fat, and inert tissue, which readily decompose and produce gastric disturbances, vomiting, &c., and which give to some preparations on the market a most repulsive smell, especially when they have been kept for a short time.

Thyroidin Tabellæ

Readily disintegrate when swallowed, and from their shape and size are taken without difficulty. If preferred, they may be dissolved in a little water before being swallowed.

One Tabellæ equals 5 grs. of gland.
Dose, 1 or 2.

Thyroidin Cachets.

THYROIDIN CACHET.

Each Cachet contains 5 grains of Thyroidin. Dose, 1 or 2. A very suitable and convenient mode of taking Thyroidin.

"A very elegant cachet."—
MEDICAL MAGAZINE.

Elixir Thyroidin

Is a very palatable, slightly sweet preparation, of which one fluid ounce represents one gland (average). It will be found to keep well without change.

Dose, 1 to 4 fluid drachms.

Chronic Psoriasis.

The success attending the use of Thyroid Extract in Myxœdema, shown strikingly in the changes that occur in the skin, has suggested its use in cases usually known as chronic psoriasis, and wonderfully successful results appear to have been obtained with ALLEN & HANBURY'S Thyroidin Tabellæ.

In a recent number of *THE LANCET* three of these cases are reported. After treatment with iodide of potassium and arsenic internally, and chrysophanic acid ointment locally, showed no improvement, but, on the other hand, the disorder was in some cases aggravated, developing a general dermatitis of the face with febrile disturbance.

But on the treatment being changed, and TABLETTS OF THYROID GLAND (ALLEN & HANBURY'S) being administered, the writer observes: Case 1.—"The improvement was very striking the scales were completely gone, and all that was left was a slight discolouration of the skin where the disease had appeared."

Case 2.—"The scalp and limbs were nearly clear. The patient, who has suffered from the disease for nineteen years past, has had no discomfort from the remedy and says that nothing has ever acted so rapidly upon his disease."

Case 3.—"The result was astonishing, for in three days there was a marked improvement, and no further spread of the disease had taken place. No discomfort was experienced from the remedy."

For full details of the above quotations see *THE LANCET*, January 6th, 1894, p. 19.

Medical Opinions on Allen & Hanburys' Thyroidin Preparations.

THE MEDICAL PRESS AND CIRCULAR writes, October 25th, 1893:—"These are manufactured with the care and attractive form for which this firm is celebrated, and the results have answered our most sanguine anticipation."

"Elegant pharmaceutical preparations. Thyroidin contains the active elements of the gland in a very concentrated form, and it is therefore very convenient for administration."
MEDICAL MAGAZINE.

"We can highly recommend them to our readers."—EDINBURGH MEDICAL JOURNAL.

"Active and therapeutically valuable."
PRACTITIONER.

"Typical specimens of elegant pharmacy in its latest developments."
THE CHEMIST AND DRUGGIST.

"Thyroidin Elixir has an agreeable flavour and appears to keep very well."
BRITISH MEDICAL JOURNAL.

The above are put up in 1/-, 2/-, and 4/- packages (retail), or 3/-, 5/-, and 40/- per dozen to the Profession.

SAMPLES SUPPLIED TO THE PROFESSION ON APPLICATION.

IMPORTANT NOTICE.

ALLEN & HANBURY'S Ltd. have pleasure in announcing to the Medical Profession that they have opened a branch for the exclusive supply of Surgical Instruments, &c., of their own Manufacture, at 48, Wigmore Street (corner of Welbeck Street), W.

ASEPTIC MIDWIFERY FORCEPS

WITH DETACHABLE ALUMINIUM HANDLES,

Manufactured by ALLEN & HANBURY'S Ltd.

ALLEN & HANBURY'S desire to bring before the Medical Profession their new Forceps, which are fitted with detachable aluminium handles. This method presents many advantages over the so-called aseptic handles now in vogue, the great defect in such being due to the fact that it is almost impossible to solder or braze the metal handles on to the Midwifery Forceps shanks without leaving a few small apertures near the seam; these afford an inlet to the acids used in the nickel-plating process or to solutions necessary for antiseptic purposes.

The chemical action of these fluids is sooner or later apparent by the appearance of verdigris or other poisonous and irritating substances on the surface of the forceps at the seam where the handle is brazed to the shaft.

ALLEN & HANBURY'S Midwifery Forceps with Aseptic Detachable Aluminium Handles are therefore free from this source of danger which is associated with instruments having brazed or soldered handles. Whilst these are an improvement on the ordinary forceps in use, the prices are not advanced. (See below.)

ANDERSON'S.

Price 24/- per pair.
Aluminium hds., 24/-.
Do. Spring Catch, 25/-.

BARNES'S.

Price 21/6 per pair.
Aluminium hds., 21/6.
Do. Spring Catch, 22/6.

GODSON'S.

Improved Aseptic.
Price 20/- per pair.
Aluminium hds., 21/-.
Do. Spring Catch, 24/-.

LYDD-DAVIS'S.

Price 20/- per pair.
Aluminium hds., 21/-.
Do. Spring Catch, 24/-.

By taking the Forceps in the left hand and pressing, with a pencil, the spring catch (situated at the end of handle) with the right hand, the handle is instantly detached, thus rendering it aseptic and easily sterilised. Emphasis should also be laid upon the fact that the handles are made of aluminium, which gives lightness (an advantage when *in situ*) handles can also be made of nickel-plated gun metal.

ALL NICKEL-PLATED.

ASEPTIC MIDWIFERY BAGS.

With MOVABLE ASEPTIC LININGS, without INSTRUMENTS (by Royal Letters Patent).

The BRITISH MEDICAL JOURNAL writes:—"A Midwifery Bag with movable aseptic lining, which seems to us to combine the advantages of safety to the patient and convenience to the practitioner. The bag is so constructed as to remain open, an advantage which will be appreciated by Practitioners."

Cowhide Bag, 16 in., with loops for bottles, to take full length Midwifery and Craniotomy Forceps, 15/-; including stoppered bottles (without cases), 18/6; in boxwood cases, 21/3.

Morocco Leather Bag, 16 in. long, 7 in. deep, made with loops to fit bottles of any size, 21/6.

This bag is deeper than the ordinary Midwifery bag sold with this size frame, rendering it more useful to practitioners in carrying additions. Full size Morocco Leather, 17 in. long, 7 1/2 in. deep, with pocket and loops for bottles, 22/6; including stoppered bottles in boxwood case, 26/3. The same sized bag in Cowhide, 20/-, with bottles, 26/3.

Any bag can also be fitted with Loops and a row of 1 oz. stoppered or corked Vials at an additional cost of 7/6. These can be filled with Tablets of Compressed Drugs, at once converting it into an emergency bag suitable for Country Practitioners.

London.

SURGICAL

INSTRUMENT

DEPARTMENT.

Australian Agency:—484, Collins Street, Melbourne.

Byno-Hypophosphites.

“A valuable Alimentary Tonic.”

Medical Press & Circular.

A Nutritive and Digestive Tonic.

A great advance on the ordinary (Sugar) Syrups of the Hypophosphites.

— This combination has been found to be of great value in tuberculous conditions in which gastric irritability is a prominent feature.

The Lancet writes :

“This is an excellent preparation, in which are ingeniously combined the hypophosphites of iron, lime, potash and manganese with the alkaloids of cinchona and nux vomica in combination with the well-known active malt essence—Bynin. We have proved its efficacy as regards digestive powers, while the tonic salts already indicated and the alkaloids of nux vomica were readily detected.”

Medical Magazine writes :

“A distinct pharmacological success.”

The Hospital Gazette writes :

“The value of such a preparation must be obvious.”

The Chemist and Druggist writes :

“May be said to fill a blank in the well-occupied field devoted to hypophosphite remedies.”

The British Medical Journal writes :

“The preparation has an agreeable taste.”

The CONSTITUENTS of BYNO-HYPOPHOSPHITES are:—(1) A neutral solution of the Hypophosphites of Lime, Iron, Potash and Manganese, whose tonic action is well known. (2) The alkaloids of Nux Vomica and Bark—viz., Strychnine, Quinine, etc., the amount of Strychnine present being accurately ascertained; e.g., gr. 1-40 in an ounce. These alkaloids are present in combination with the natural acids as found in the plants from which they are derived, this condition rendering their absorption easier and their action more certain. (3) BYNIN—Liquid Malt—our well-known preparation, which by its pleasant flavour covers the bitter taste of the hypophosphites and alkaloids. Further, it does away with the necessity of using sugar, which, as found in the ordinary syrups of the Hypophosphites, is liable to cause dyspepsia and upset the stomach. Beyond these advantages it yields, of course, all the benefits which are ordinarily to be gained by taking Extract of Malt in aiding nutrition and digestion.

Byno-Hypophosphites is put up in capsuled bottles at 2/6 and 4/6, and sold by Chemists everywhere. Price to the Medical Profession, 24/- and 41/- per dozen. SAMPLES SUPPLIED ON REQUEST.

Allen & Hanburys Ltd. Plough Court, Lombard Street, London.

Laboratories & Warehouse: BETHNAL GREEN, LONDON, E. Cod Liver Oil Factories: LONGVA & KJERSTAD, NORWAY.

West End Branch: VERE ST., CAVENDISH SQUARE, W. Australian Agency: 484, COLLINS ST., MELBOURNE.

NOURRY IODINATED WINE.

The only Preparation of Iodine which is **uninjurious** to the digestion.

The only Preparation of Iodine of agreeable taste and easily given to children.

AN EXCELLENT SUBSTITUTE FOR COD LIVER OIL AND IODIDES.

Prescribed by eminent Physicians to **lymphatic** and **scrofulous** children; to adolescents for **troubles** associated with growth, **amenorrhœa**, &c.; to adults for **asthma**, **emphysema**, **syphilis**, &c., to **convalescents** from infectious diseases, &c.

THE LANCET OF JANUARY 6TH, 1894, SAYS:—

"This interesting preparation demands some attention and consideration since it claims to offer a means of presenting iodine in a form that is devoid of metallic taste, permanent in character, not giving rise to disagreeable effects, and yet yielding the element in a free state when ingested."

After explaining the difficulty of extracting all the iodine, **THE LANCET** analysis proved that the wine contains no free iodine and yielded 2.5 gr. of iodine per 1000 c.c.

"In view of these results we regard this wine as an introduction of distinct importance in therapeutics, since it appears to place the use and administration of a valuable medicament on a more satisfactory basis than heretofore. Iodine has been sparingly employed hitherto, on account of its irritant and other disagreeable properties; the above preparation, therefore, which contains no free iodine, but which yields it in full quantity on the slightest

provocation, is calculated to lead to more extended application. It certainly deserves trial."

NOURRY'S IODINATED WINE is not advertised to the Public; it owes its success entirely to the Medical Profession.

Price 3/6 per Bottle. Special terms for Physicians.

Hypodermic Medication.

"TABLOIDS" versus READY-MADE SOLUTIONS.

In cases of emergency, when the patient is perhaps in a most critical condition, and when the physician has recourse to the hypodermic method as a *dernier ressort*, it is of supreme importance that he should be able to feel perfect confidence in the agents he uses. Alkaloids are not very stable things at the best, and when in solution they cannot be relied upon to remain constant in composition for even a short space of time. It is stated in the B.P. that two out of the three hypodermic injections contained therein, viz., those of Apomorphine and Ergotine, should be made as required for use. Is this possible in the majority of cases? Can a patient who has been poisoned in the one instance, or

Unreliability of ready-made Solutions.

who is suffering from hæmorrhage in the other, wait whilst the aid of a chemist is being invoked for the preparation of the hypodermic solution? It goes without saying that he cannot, and for this reason the two preparations in question might just as well not be in the Pharmacopœia at all. It is to be expected that products of decomposition will produce serious results when taken into the system, and even supposing that a solution which has "gone wrong" does not do any harm, it is likely to be absolutely without therapeutic effect, and this is in many cases as bad.

The employment of various antiseptics as would-be preservatives was tried, but failed to altogether prevent the formation of micro-organisms, and for a long time the unreliable character of solutions remained one of the obstacles to the more general employment of the hypodermic method.

Hypodermic "Tabloids."

Hypodermic "Tabloids" obviate these difficulties and meet every possible requirement. Since solutions which had been made for some time could not be used without incurring grave risks, we turned our attention to devising a method whereby they could be made with ease and celerity at the time of using, thus doing away with the possibility of deterioration and the consequent production of untoward effects. With these ends in view we introduced Hypodermic "Tabloids," each "Tabloid" containing an absolutely exact quantity of alkaloid or other agent, combined with a perfectly stable and innocuous base. That the active principle must be pure goes without saying, but it is also a *sine quâ non* that the basis used should be completely inert. The presence of an extraneous substance for the

purpose of either hastening disintegration or aiding the dissolution of principles which, though therapeutically powerful, are yet delicate of constitution, is highly objectionable; indeed, an acid salt is likely to be positively injurious to the system when subcutaneously introduced, even if it do not interfere with the action of the drug with which it may be associated. The BRITISH MEDICAL JOURNAL reports on Hypodermic "Tabloids" that they are "free from irritative acid salts," thus recognising this very important characteristic; and THE LANCET also says of them that they are "very soluble and not at all irritating." Further, "Tabloids" obviate the possibility of over-dosage, since each contains one dose and no more.

The *modus operandi* with Hypodermic "Tabloids" is simplicity itself. A very prominent advantage in connection with these "Tabloids" is their extreme portability. A tube, less than two inches long and about the diameter of a goose-quill, holds in most instances twenty doses, and a number of tubes of various agents sufficient to meet a very wide range of requirements may be carried in the waistcoat pocket without their presence being felt. We think, therefore, that we are justified in claiming that no other method for the immediate preparation of solutions offers to medical practitioners the same advantages as the employment of Hypodermic "Tabloids."

a Morphine Hydrochlor.	1-6 gr.		

Hypodermic "Tabloids" supplied in tubes of non-actinic glass, each containing 20 "Tabloids" (except those marked with asterisks, which contain only 12). Those marked a, -/6 per tube; those marked b, -/8 per tube. The prices of Pilocarpine "Tabloids" 1-10 gr., 1-6 gr., and 1-3 gr., are 1/11, 3/2, and 3/8 per tube respectively.

A NEW SYRINGE.

The Patent Aluminium Syringe (B., W. & Co.) is adapted for use with all solutions for subcutaneous medication, and is not affected by any climatic condition. The Syringe has a

sheath of pure aluminium which renders it incorrodible, and also much less weighty than the usual heavily-cased instruments; it can be quickly and easily taken to pieces, and may be readily and perfectly sterilised with absolute alcohol. Price, with two needles, 7s.

HYPODERMIC POCKET CASES.

We have mentioned the portability of Hypodermic "Tabloids." With a view to providing medical men with complete hypodermic equipments in a compact and convenient form, we supply pocket cases, each arranged to contain a hypodermic syringe, two needles, a selection of alkaloids and other agents in "Tabloid" form, and a small glass mortar and pestle for crushing the "Tabloids." A case of this kind furnishes the medical practitioner with a perfect hypodermic armamentarium.

THE SUBLINGUAL ADMINISTRATION OF "TABLOIDS."

Considerable attention has lately been called to a mode of administering the "Tabloids" which should be much more widely known than it appears to be at present—namely, by placing them under the tongue. Either the "Tabloid" itself may be placed in its entirety beneath the tongue, or a solution of it may be made in the usual way and a few drops allowed to fall under that organ. There are many cases in which this method will be found of infinite service and even preferable to injection subcutaneously, on account of the unfavourable impression often created upon the mind of the patient by the latter method, and the effect such a feeling may have upon the general condition. It is believed that if the efficiency and celerity of effect shown by this method were only made more generally known it would be practised to a very large extent, and would be of considerable use in dealing with a certain class of patients.

TRADE *Emol-Keelet* : MARK

SINCE our first leaflet dealing with Emol-Keelet was issued we have received many encouraging reports of the beneficial effects of this substance in Surgery and Dermatology. It has been used not only for its absorbent, anti-pruritic, and emollient qualities, but also as a diluent for such antiseptic agents as Loretin, Dermatol, Iodoform, Boric Acid, Chrysophanic Acid, Hydro-Naphthol, &c. Owing to the fact that it is a natural powder containing a large proportion of native silicates, Emol-Keelet is chemically stable, and is therefore freely prescribed as a diluent for potent medicinal agents without

fear of combination taking place. In addition to these chemical advantages, its soft silky texture, soothing influence, and other physical qualities enhance its healing action.

In a paper reported in the March number of the *Glasgow Medical Journal* Dr. G. A. Turner, President of the Glasgow Obstetrical and Gynecological Society, speaks very highly of a mixture of Emol-Keelet with Loretin (meta-iodo-ortho-oxiquinoline-ana-sulphonic acid) in the treatment of the umbilical cord immediately after birth. The proportions originally suggested for an absorbent antiseptic powder were :

Emol-Keelet, nine parts,
Loretin, one part ;

but since then it has been found that 1 or 2 per cent. of the latter body is amply sufficient.

The following paragraph from the paper referred to will show what a wide field exists for the advantageous use of Emol-Keelet with Loretin.

"It has been suggested that Loretin, when mixed with a little magnesia, is well adapted for use as a dusting powder. For such use, undiluted, it would be too expensive, nor is it necessary. It may be used mixed with magnesia, or Fuller's earth, or with the dusting powder, Emol-Keelet, which was recently brought prominently before the profession at the meeting of the British Medical Association at Newcastle-on-Tyne, by a paper read by the president of the Dermatological Section, Dr. Allan Jamieson, of Edinburgh." He concluded that Emol-Keelet as a dusting-powder is a "perfectly innocuous and inoffensive material, therapeutically superior to any previously known."

"A short time ago I wrote Messrs. Burroughs, Wellcome, & Co. of London, making the suggestion that a mixture of Loretin and Emol-Keelet would probably prove a valuable dusting powder for infants. I received a reply, from which the following is an extract : 'The suggestion which was originally made to use magnesia as a diluent of Loretin was made on the grounds that magnesia is so good an absorbent, is comparatively cheap, popular with some continentals in this direction, and very harmless. The suggestion now made by yourself that Emol-Keelet be used as a diluent is, in our judgment, a most admirable one, and one which should have very excellent results.'

"What I have to suggest, then, is that by the use of some such dusting powder as this our treatment of the new-born infant will be brought more into line with present-day antiseptic midwifery and surgery ; the common excoriations of the skin surrounding the genital organs &c. will in great measure be avoided, and all such troublesome complications as excoriations and fungating excrescences of the umbilicus, or ulceration or sloughing of its margin, and erysipelas neonatorum and tetanus neonatorum will be things of the past."

Beth Emol-Keelet and Loretin may be obtained from all first-class pharmacists, so that if practitioners prefer to use higher or lower percentages than those mentioned they can easily obtain them by prescriptions.

We append the testimony of a few eminent authorities on Emol-Keelet :—

THE LANCET says :—

"On account of its remarkable velvety smoothness it should possess a unique value as a dusting powder in the treatment of cutaneous diseases &c., and for allaying irritation. We have not examined a more unctuous earth."

BRAITHWAITE'S RETROSPECT OF MEDICINE, says :—

"Emol-Keelet is the most beautiful impalpable mineral powder with which we are acquainted, and promises to supersede all the older forms of dusting powders. Beyond the purely mechanical effect of covering and protecting from friction or irritation the surface to which it is applied, Emol-Keelet is possessed of distinct emollient and soothing properties, as well as being a most efficient anti-pruritic. We have made use of it for some time past in the treatment of eczema, especially in infants and young children, where dry and soothing agents are most desired, and have found it to be a most excellent application in such cases, while the readiness with which it can be used and its absolute freedom from all risks of decomposition, add largely to its value. It has also proved to be of great use in the removal of epidermal concretions such as are seen in eczematous conditions of the palms and soles. We can most confidently recommend it as an addition of great value to the resources of the dermatologist."

The QUARTERLY MEDICAL JOURNAL says :—

"As a dusting powder it has the advantage that when the part to which it has been applied becomes moist, it forms a kind of natural soap, and is free from the "balling" tendency of many insoluble powders. It forms a pleasant, effective tooth powder, not being liable to scratch the enamel."

The EDINBURGH MEDICAL JOURNAL :—

"Having ourselves extensively tested it, we can most warmly recommend it."

The DUBLIN MEDICAL JOURNAL says :—

"An excellent topical application after vaccination."

The SANITARY RECORD says :—

"Superior to other powders of this kind."

A CORRESPONDENT, PRACTISING IN THE NORTH OF SCOTLAND, writes :—

"Within the last fortnight I came across a very severe case of eczema infantile of the face, head, and other parts of the body. After trying some other remedies with doubtful effect, I bethought me of your Emol-Keelet, and gave some to the mother to use as directed. Its effect has been most gratifying to myself, and highly beneficial to the little sufferer, who is only seven months old."

AS FURTHER EVIDENCE OF THE UTILITY OF THE NEW PRODUCT, WE QUOTE THE FOLLOWING EXTRACT FROM A LETTER FROM AN EMINENT SURGEON :—

"I beg to state that since Aug. 30th, 1894, I used Emol-Keelet to a big and sluggish ulcer on a man's arm with better results than I had previously obtained from dressings. The ulcer closed up rapidly after commencing with Emol-Keelet, and it is now practically healed up. It held on a stubborn course for about four months, but, being due to blood-poisoning, I was not surprised ; yet I firmly believe that if I had had the Emol-Keelet earlier the ulcer would not have been so sluggish in healing."

AN INFIRMARY HOUSE SURGEON writes :—

"I have used Emol-Keelet in the case of acute irritation and rawing of the skin from bilious secretions through a fistulous opening. Everything I could think of having failed I tried the powder, and it has acted splendidly, and has been very comforting to my patient."

BURROUGHS, WELLCOME & CO.

Ascertained

Maltine

Facts.

REGISTERED TRADE MARK.

Value of "Maltine" contains from three to five times as much diastase as any other Extract of Malt in the market."

—Prof. ATTFIELD.

"As to diastase-converting power, 'Maltine' is superior to the best Extracts of Malt I have ever seen."

—Prof. STUTZER, Bonn.

"Repeated experiments show that 'Maltine' converts from 25 to 30 times its own weight of starch into sugar."—Prof. C. MÉHU, Paris.

in Diastase.

"'Maltine' exhibits in an eminent degree the starch dissolving power of diastase; in fact, a teaspoonful is capable of converting instantaneously a surprising amount of stiff starch paste into a thin limpid liquid."—THE LANCET.

Albuminoids.

"Extracts of Malt (i.e., malted barley) are pretty widely known, but in 'Maltine' we find the first example of a combination of the nutritious principles of these three cereals. The greater value of this combination is apparent, as wheat and oats are especially rich in muscle- and fat-producing elements; clinical experience enables us to recommend it as a nutritive agent in virtue of its albuminoid contents."

—BRITISH MEDICAL JOURNAL.

"'Maltine' contains more flesh-forming substance than any other Extract of Malt."

—Prof. DEPAIRE, Brussels.

Phosphates.

"Contains more bone-producing substance than any other Extract of Malt."—Prof. DEPAIRE, Brussels.

Carbo-**Hydrates.**

"'Maltine' contains a large proportion of the digested carbohydrates, dextrine and maltose. The superior diastasic activity of 'Maltine' converts into assimilable form and utilises for the organism a far larger amount of farinaceous food than is the case with other extracts of malt."

International Health Exhibition, London, awarded the only GOLD MEDAL for Malt Extracts to

"MALTINE."

The delicate flavour and convenient consistence of "MALTINE" recommend it to patients who cannot take the dense unpalatable extracts.

In 8-oz. and 16-oz. Bottles and Winchester Quarts. SAMPLES FREE TO MEDICAL MEN.

In prescribing, kindly specify **"MALTINE CO."**

THE MALTINE MANUFACTURING CO., Ltd.,
24 & 25, HART STREET,

CARNRICK'S BEEF PEPTONIDS.

(Concentrated Beef and Milk with Gluten, Sterilised and partially Peptonised.)

In the preparation of Beef Peptonoids, the flesh-forming elements of beef, wheat, and milk are used, constituting a nitrogenous and nutritive food of the highest value. It is not an "extract of beef" as ordinarily understood. We use the entire nutritive product of lean beef, excepting the muscular tissue, from which the water has been previously evaporated. Beef Peptonoids in the form of a powder is not a pure peptone, it being only partially digested.

Beef Peptonoids is very rich in albuminoids. Dr. Stutzer, of Bonn, who examined the various preparations of meat in the market, declares that it is far in advance of any of the others in this respect.

"Carnrick's Beef Peptonoids," states the same authority, "presents another distinguishing mark, as it contains a not inconsiderable quantity of heat-producing and albumen-economising elements, such as fat and dextrine." Comparing Beef Peptonoids with beef-tea, he states: "It would take 80 pints of beef-tea, made from 80 lbs. of steak, to obtain the flesh-forming constituents present in 1 lb. of Beef Peptonoids."

"A most concentrated form of nitrogenous food, easy of digestion and well adapted and convenient for medical use."—THE LANCET.

"The distinguishing character of the preparation is the large proportion of soluble albumen present in combination with the extractives and salts that are valued for their stimulating properties. Carnrick's Beef Peptonoids have won high approval as an excellent dietetic preparation."

—BRITISH MEDICAL JOURNAL.

Being made of the three great varieties of food—beef, wheat, and milk—patients seldom tire of it, while they soon tire of the use of any one of the above.

In 4-oz. and 16-oz. Tins, 3/6 and 12/-. To the Profession, 3/1 and 10/10, carriage paid.

We shall be pleased to send SAMPLES of any of our Preparations FREE OF CHARGE to MEDICAL MEN.

The Value of Saccharin

IN DIABETES MELLITUS, GLYCOSURIA, GOUT,
OBESITY, AND ALL DISEASES IN WHICH
SUGAR IS FORBIDDEN.

SACCHARIN "TABLOIDS."

There are certain illnesses and diseased conditions of the body which can only be effectively treated by a strict observance of a suitable diet, and by a manner of living that operates against the consequences of the diseases, or at least keeps them within such bounds that the general health of the patient remains good for a long while, in spite of his diseased condition. A special diet has to be scheduled for each separate individual, according to his physical state, and since dietetic regimen is almost always a penance, he is sure to be thankful if his food can be made more palatable and more varied by the utilisation of a harmless, indifferent spice.

Saccharin. Diabetic patients, from the very fact that sugar is denied to them, often have such a craving for sweet things that withholding of them exercises a great influence on their mental condition. And this will make manifest the enormous benefit which the introduction of Saccharin has conferred upon all those whose conditions make it necessary that sugar in every form should be avoided. It is not too much to say that monotonous and unpalatable diets do more harm to many patients than the disease from which they suffer.

Its absolute harmlessness. The absolute harmlessness of Saccharin has been conclusively proved by numerous and thorough scientific experiments and researches, and experience has corroborated the results arrived at. It has been shown that Saccharin produces no injurious effects whatever upon the body: that it is discharged after a short stay, unchanged and in its entirety, through the urine and feces; that it is absolutely indifferent as regards the functions of the body; lastly, that it exercises no influence on either assimilation or digestion.

It satisfies the palate. When, therefore, sugar (the ordinary carbo-hydrate) in any form is prohibited as an article of food, or as spice, it may be asserted without fear of contradiction that the administration of Saccharin, whilst satisfying the palate of the patient, cannot possibly aggravate the existent conditions; on the contrary, its antiseptic influence may be for good.

Saccharin "Tabloids." Saccharin "Tabloids" are portable, and of the greatest convenience to those travelling or away from home during the day, as a "Tabloid" or two will sweeten a cup of tea, coffee, &c., as well sugar. A little spoon accompanies each bottle of Soluble Saccharin; this spoon once or twice full is also sufficient to sweeten a cup of tea or other beverage.

Saccharin is supplied to the Medical Profession in 1-oz. bottles at 4/6 each; Soluble Saccharin in 4-oz. and 1-oz. bottles at 1/2 and 3/10 each; Saccharin "Tabloids" in bottles of 100 and 200, at 7d. and 1/1 each.

CASCARA SAGRADA "TABLOIDS."

✓ Cascara Sagrada is one of the most reliable laxatives in constipation due to sluggish liver and atony of the bowels. Probably no drug in *Materia Medica* varies so much as this; frequently barks of allied species of *rhamnus*, or imperfectly matured barks, are used for manufacturing purposes. Preparations from these invariably cause much pain and dis-

comfort to the patient. In making "Tabloids" of Cascara Sagrada, the bark is carefully collected and matured, the extract is then prepared by a special process and made into "Tabloids." This is really why they have become so popular with the Medical Profession, and why such uniformly good results are obtained.

Cascara Sagrada "Tabloids" (plain or sugar-coated) are supplied to the Medical Profession, in bottles of 25 and 100, at 5d. and 1s. each.

"TABLOIDS" OF TINCTURES.

The objections to the spirituous solutions known as Tinctures are so great as to render the introduction of an efficient substitute a necessity. The indefinite and unequal nature of Tinctures has been fully recognised in official quarters. The Pharmacopœia Committee of the General Medical Council some

Objections to Tinctures.

time ago considered and debated the subject, and finally came to the decision that Tinctures ought to be standardised. This undoubtedly renders them reliable when quite fresh, but does not lessen to any appreciable degree the chances of subsequent deterioration. Further, Tinctures, like most liquid preparations, are bulky, cumbrous, and awkward to carry about, and they involve the necessity for measurement with its attendant chances of error in dosage. Physicians and patients alike will hail with satisfaction a reliable, accurate, and convenient method of administration, ensuring freedom from risk of mistakes. How greatly are the miseries of the sick and invalid increased when they are required to take evil-tasting and nauseating compounds!

From all points of view.

More often than not these compounds owe their nastiness to one or more Tinctures, and in such cases to many children and fastidious patients the remedies are very truly worse than the complaints. Whether from the physician's, the pharmacist's, or the patient's point of view, Tinctures are open to grave objections.

It is an easy matter to indicate faults and deficiencies in an existing state of things; it is quite another, and much more difficult, to propose an efficient remedy. It was pointed out to us that it is only in very exceptional cases that the properties of spirit are desired by the prescriber, therefore there was no reason why it should be retained.

We made this fact the basis of our experiments, and as the result of the expenditure of much time and trouble we succeeded in preparing "Tabloids" of Tinctures, containing all the active principles and all the therapeutic activity of the Tinctures themselves, but without the alcoholic body. "Tabloids" of Tinctures are very small, consequently very easy to swallow; being prepared from freshly standardised Tinctures, they are absolutely accurate in dosage, each "Tabloid" representing a given quantity of Tincture, and thereby doing away with the necessity for measurement. One of the most important characteristics of "Tincture" Tabloids, and, for the matter of that, of "Tabloids" generally, is their extreme portability, which offers to business people and to all who are continually moving about such facilities for taking their prescribed doses with regularity as are obtained by no other method.

"Tabloids" a perfect substitute.

BURROUGHS, WELLCOME & CO.

Burroughs Wellcome & Co., Snow Hill Buildings, LONDON.

Cable and Telegraphic Address—"BURCOME, LONDON."

“Tabloids” of Compressed Drugs.

TRADE MARK.

(Burroughs, Wellcome & Co.)

THE PLACE OF “TABLOIDS” IN MODERN PHARMACY.

Conservatism in Pharmacy is quickly becoming a thing of the past. Mixtures, pills, and other old-fashioned forms of medicine are being universally discarded in favour of “Tabloids” of Compressed Drugs, and seeing the enormous benefits to both physician and patient presented by the latter, this is not a state of things to occasion any surprise. “Tabloids” may fairly claim to be the most scientific form of medication yet devised. To medical men practising in large towns where the pharmacy is handy, and the inconveniences of the old regime are least felt, as well as to those who live in rural districts where a supply of drugs is possibly many miles away, “Tabloids” offer a great saving of time and trouble, and at the same time lessen that risk of error in dosage which is always present when patients themselves or their inexperienced friends weigh or measure out their medicines. Each “Tabloid” contains an exact quantity of pure drug or combination of drugs, as the case may be. “Tabloids” are readily soluble, or when insoluble drugs are implicated, disintegrate immediately on coming into contact with moisture; their shape enables them to be much more easily swallowed than round pills, they are elegant, almost tempting in appearance, they do not excite the feeling of disgust which pills often do, and they never produce nauseating effects.

The last point is undoubtedly one of very special importance. It is a recognised fact that the influence of the mind over the body is such that whims and fastidiousness of patients in respect to nauseous and palate-offending medicines cannot be ignored. Patients often deceive their medical advisers by secretly destroying or throwing away medicines, the taste or appearance of which is repulsive; as a natural result, if the patient die, or derive no benefit, the physician, or the drug, or both bear the blame.

In addition to removing the patients' objections to taking their medicines, “Tabloids” are so compact and portable that patients travelling or attending to business, professional or official duties, can easily carry them in the pocket without the least inconvenience. “Tabloids” are consequently very specially adapted for the fitting of medicine cases and chests.

LIST OF “TABLOIDS” OF COMPRESSED DRUGS.

Corrected up to June 29th, 1896.

* Those marked thus may be had beautifully coated with pure white sugar.

† Those marked thus may be had sugar- or keratin-coated.

Official Text of Award conferred upon “Tabloids” at the Chicago Exhibition.

“For purity of the medicines used in compounding; for ready solubility of the coating and ingredients of the “Tabloids”; for the improved method of manufacture, and general appearance of the manufactured article.”

Burroughs Wellcome & Co., Snow Hill Buildings, LONDON.

Cable and Telegraphic Address—“BURCOME, LONDON.”

FURTHER IMPROVEMENTS

IN THE MANUFACTURE OF

HARTMANN'S PATENT WOOD WOOL WADDING

AND

HARTMANN'S PATENT WOOD WOOL TISSUE

We have now succeeded, by the aid of **new machinery**, in turning out these Patent Dressings to a degree of softness and evenness upon which it would be impossible to improve, and we ask **every surgeon** to try our latest make free of charge.

OVER
TWO HUNDRED THOUSAND POUNDS
ARE USED ANNUALLY

By the leading Operating Surgeons of the day. What better proof of their value can be given?

We claim the following Advantages for our Hartmann's Patent Wood Wool Dressings:—
 They absorb all kinds of discharges. They give perfect drainage to wounds, frequent change of dressing is avoided, and therefore the greatest economy attained. They are thoroughly antiseptic, as they consist mostly of Pine Wood. On a wound they will be found to thoroughly suck up and absorb all discharges, and they will not stick to the wound, nor will they heat like cotton wool and other dressings. Invaluable for Suppurating and Cancerous Wounds.

We now put up our Hartmann's Patent Wood Wool Wadding and Tissue in
ANTISEPTIC (Sublimated) and ASEPTIC (Sterilised) FORMS

IN 1-LB. PACKETS.

to meet the views of all Surgeons.

IN ½-LB. PACKETS.

By Hartmann's patent method of packing sterilised Dressings, we have at last overcome a difficulty in obtaining a thoroughly ASEPTIC dressing at a cheap price.

These packets are most portable, cost only a fraction more than ordinary antiseptic dressings, and possess many advantages over the former expensive methods of packing sterilised dressings in glass jars and tins.

THE LANCET says: "We can recommend these sterilised dressings to the medical profession."

LONDON, E.C. Telegraphic address "LIGATURE, LONDON."

BOVRIL,

THE VITAL-PRINCIPLE OF PRIME OX BEEF IS 50 TIMES MORE NOURISHING THAN ORDINARY EXTRACT OF MEAT OR HOME-MADE BEEF TEA.

BARON LIEBIG discovered and publicly avowed the unsuitableness of Meat Essences, Meat Extracts, and home-made Beef Tea as resuscitating agents or as food in any direct sense.

BOVRIL was introduced to supply the nourishment so conspicuously absent in these preparations, and this is secured by the introduction of albumen and fibrine (or rather the entire lean of beef) desiccated at a low temperature by special process, and subsequently pulverised to a minute degree of subdivision. By this means the entire nourishment of animal food is adapted to the feeblest and most sensitive stomach, and perfect assimilation is secured with the least possible expenditure of vital energy.

INVALID BOVRIL

Is specially prepared for use in the Sick Room. It is put up in porcelain jars and sold by chemists and druggists only; and it differs from ordinary Bovril in being more concentrated and quite devoid of seasoning.

It is the most perfect form of concentrated nourishment at present known, and is relished and retained by Invalids when ordinary food and stimulants are rejected.

BOVRIL BEEF JELLY

Is prepared from selected Ox-beef extracted by gentle heat without added water, and packed in glass jars, avoiding all injurious contact with metal.

This Essence of Beef can be safely relied upon as an admirable stimulant and restorative in cases of nervous exhaustion, loss of blood, sudden shock, or in severe illness where no other food can be tolerated by the patient.

BOVRIL, LTD., FOOD SPECIALISTS, LONDON.

"THE QUEEN OF TABLE WATERS."

*"The results of the recent investigations
"in Paris and the Report of the Académie
"de Médecine of France have placed
"Apollinaris Water at the head of all the
"waters examined for purity and freedom
"from disease germs."*

Antitoxine

(Strengthens the Heart's Action)

is a Coal Tar product, and is in no way connected with the Diphtheria Anti-toxic Serum. In hospital practice it has been demonstrated to be a powerful heart stimulant as well as a most efficient antipyretic and antineuralgic. It may with absolute safety be placed in the hands of chronic sufferers from Neuralgia or Headache, as, unlike other antipyretics, it is never known to depress the heart's action in the slightest degree, but, on the other hand, adds tone and strength to the action of a weak heart, when administered for the reduction of fever or the relief of pain.

IN LETTERED TABLETS.

Years before the new Diphtheria Remedy was discovered, this antipyretic was known and prescribed as "Antitoxine." Please note and remember this, as we are wrongly accused of appropriating the name.

4/9 per oz.
FOR DISPENSING ONLY.

IN PLAIN TABLETS.

All Samples are forwarded to Physicians and Surgeons on application to the Sole Agents:
Messrs. BARCLAY & SONS, Ltd., 95, Farringdon Street, London.

Prize of 16,600 francs.

QUINA-LAROCHE

CINCHONA WINE.

This ELIXIR is the most powerful and valuable of the preparations of Quinine as a strengthening and anti-febrile restorative. It has a very pleasant taste and has been employed in the hospitals with immense success in cases of Weakness and General Debility, Loss of Appetite, Indigestion, Changes of Life, Nervousness, Exhaustion, Slow

Convalescence, Fevers, and the After Effects of Fevers which have resisted all Quinine.
ALSO prepared with IRON.
For Purifying the Blood. For Scrofulous Affections.
For Chlorosis &c.

(Liquor Carnis with Malt and Cocoa).

9d., 1/9, 4/6 retail.

L. C. C. MEAT JUICE

(Formerly known as Shepperson's Meat Juice).

"This is a very excellent preparation of meat juice, manufactured by the Liquor Carnis Company. It contains the albumins and albuminoids in their raw condition in a greater abundance than many other preparations of the same character, and is an invalid food of the highest nutritive value. It is sold, moreover, at a most reasonable price. Nothing has done more to limit the consumption of a form of food invaluable to invalids than the exorbitant price at which most of these preparations are sold. The taste of this preparation is more palatable than most others of its class."

GOLD MEDAL, INTERNATIONAL EXHIBITION, 1884.

SILVER MEDAL, CALCUTTA EXHIBITION, 1884.

MIST. PEPSINÆ CO. C. BISMUTHO (HEWLETT'S).

COMPOSITION—Pepsine, Liq. Bismuthi, Sol. Opil Purif., Hydrocyanic Acid, P.B., Tinct. Nux Vomica, &c.

Highly recommended in various forms of dyspepsia, having a direct action upon the mucous membrane of the stomach and intestines as a sedative. It can be administered with marked and almost instantaneous effect in the irritative form of dyspepsia, more especially when pyrosis is a conspicuous symptom and pain occurs an hour or more after food. In simple neuralgic gastric pain following eating, occurring in feeble subjects, it is especially indicated, and even in *acrotoms* it has been used with great success in alleviating pain and vomiting.

In the dyspepsia of patients, dependent upon some organic disease, and where there is a decided loss of nerve power, it is of singular service. Thus, for instance, a person after a meal complains of a peculiar gnawing and emptiness, with slight pain at the epigastrium—evident signs of general relaxation and loss of nerve power. Clinical experience has shown that it is of great service as a tonic and stomachic. A portion of its value arises, it may be, from its action upon the spinal motor nerve-centres. Be these things as they may, experience has abundantly demonstrated the value of the compound as a stomachic, antidyseptic, and tonic. In general functional atony and relaxation, and in the various forms of dyspepsia, constipation, or diarrhoea, connected with atony of the visceral muscular coat, the MIST. PEPSINÆ CO. C. BISMUTHO is a very valuable remedy. In the exhausting purging of *Phthisis* accompanied with night sweats and restlessness Dr. Mathews, of Nantwich, has used it with marked and appreciable effect.

Price 10s. 6d. per lb.

Dose—Half to one drachm, diluted.

Physicians will please write "Mist. Pepsinæ Comp. (Hewlett's)."

INTRODUCED AND PREPARED ONLY BY

G. J. HEWLETT & SON, Wholesale and Export Druggists, 40, 41, & 42, Charlotte St., LONDON, E.C.

SAMPLES and LITERATURE of the under-mentioned Specialities will be sent free to the Medical Profession on applying to

PAPAIN

(Dr. FINKLER & Co.)

POWDER,
LOZENGES,
TABLETS,
PILLS.

LIQ. ACID GLYC.,
" IRIDINE,
" CASC. SAG.,
" BISMUTH.

PAPAIN

(Dr. FINKLER & Co.)

An ideal purely vegetable Digestive Ferment, with tonic and antiseptic action. It digests meat albumen in acid, neutral, and alkaline media, thus exercising its action throughout the digestive tract. It gives immediate relief from gastric discomfort in all forms of Dyspepsia.

Recent reports prove Papain (Dr. Finkler & Co.) of special value in the treatment of Chronic Gastric Ulcer (see Dr. G. Rankin's report in THE LANCET, 9th Feb., 1895, p. 333), and of Atonic Dyspepsia (see Dr. Younger's report, THE LANCET, 27th April, 1895, p. 1050). See also published reports by Medical Men and the Medical Press.

It is respectfully suggested to add "FINKLER" in brackets in prescribing, and to make sure of obtaining the Original Package, closed with Trade Mark and Signature as on the above facsimile.

DIURETIN

(KNOLL).

A TRUE DIURETIC.

It is indicated in all cases of Dropsy arising from Cardiac and Renal Affections. Most excellent results have been obtained in Cardiac Hydrops. In Chronic Nephritis its action has been shown to be superior in most cases to all other Diuretics. The improvement in the heart's action and the simultaneous stimulation of the renal epithelium effect results otherwise unattainable. (See lately published pamphlet.)

FERROPYRINE

(KNOLL).

is indicated in Chlorosis and Anæmia, and especially in such cases as are accompanied with Headaches, Migraine, Gastralgias, and similar Neuralgias. (See pamphlet.)

EXALGINE

(BRIGONNET).

An analgesic of high merits, which obviates and does not merely stifle pain, and this without giving rise to any collateral inconvenience. It is indicated in most cases of Neuralgic and Rheumatic condition. (A pamphlet containing all recent reports is now in print and will be shortly published.)

ETHYL CHLORIDE

(Dr. BENGUÉ).

With PATENT SPRAY & STOPPER.

Produce in an economic and readily effective manner Local Anæsthesia for Dental and Minor Surgical Operations. By applying the spray in Neuralgic Headaches, Sciatica, Rheumatic Pains, &c., to the part affected almost immediate and lasting relief is obtained.

ANESTILE

(Dr. BENGUÉ).

Sold by all Wholesale Druggists and Retail Chemists, or where not obtainable please apply direct to

B. KÜHN, 36, ST. MARY-AT-HILL, LONDON.

THYROID EXTRACT

(FOR MYXEDEMA).

A Glycerine Extract of fresh Thyroid Glands, uniform in strength. Prepared from healthy glands, selected under veterinary supervision. A permanent preparation not liable to decomposition. Well suited for internal administration. A certain remedy for the hitherto inevitably fatal Myxœdema. Useful in Goitre, Cretinism, &c. Found very successful in the treatment of Psoriasis (see BRIT. MED. JOURNAL, Oct. 28th, 1893, page 933). Exerts a wonderful effect on the nutrition of the skin, and hence deserves wide trial in skin diseases. Promotes the growth of the hair and may prove of use in baldness of some kinds.

Price 3s., in 1-oz. stoppered bottles. Dose—ix. to 3j.

THYROIDINE, containing the active principle of the Thyroid Glands of the sheep, 4 grains equal to about one-eighth of a fresh gland. Also PILLS and TABLETS, each containing a dose of Thyroidine.

In bottles, 2s. 6d. each.

VAPO-CRESOLENE.

HAS PROVED ITSELF A MOST VALUABLE REMEDY.

IN THE TREATMENT OF INFLUENZA, WHOOPING COUGH

Asthma, Catarrh, Diphtheria, Croup, Hay Fever, Sore Throat, and Diseases of the Air Passages.

It is the Safest and Simplest Method for Destroying Infection and Purifying the Air.

It is now an admitted fact that Zymotic Diseases, as Scarlet, Typhoid and Typhus Fevers, with Whooping Cough, Croup, Measles, and Diphtheria, are generated by the agency of bacteria and other low forms of life. These bacteria develop with great rapidity, those in the air passages being with difficulty reached even by atomisers and other spraying machines, which fail in achieving other than a local and partial result; and it is essential that a strong antiseptic agent be applied directly and continuously to these living organisms. This can be most successfully accomplished by the volatilisation of VAPO-CRESOLENE until the air of the room is thoroughly charged with the vapour, and the patient is thus brought under the beneficial influence of this valuable germ destroyer.

VAPOURISER and LAMP, with a 2-oz. bottle of Cresolene, neatly boxed, 8s.; Additional Cresolene, 2-oz. bottle, 1s. 1/4; 4-oz. bottle, 2s.; obtainable of any Chemist or from

ALLEN & HANBURY'S Ltd.,

Plough Court, Lombard Street, London; and at 7, Vere Street, Cavendish Square, W.

MALTO-PEPTONE MALT EXTRACT JELLY

Contains the whole value of MALTED BARLEY—not only its diastase principle, but also the soluble nitrogenous matter contained in the BOOTLETS, and extracted by a special process.

MALTO-PEPTONE MALT EXTRACT JELLY with COD LIVER OIL.

The most convenient and palatable form in which to administer COD LIVER OIL to Children and Invalids. Being a jelly it can be taken in small pieces, which can be instantly swallowed without causing nausea. The ease with which it is assimilated is remarkable.

In 6-oz. and 16-oz. Glass Jars, 1/9 and 2/9.

SAMPLES FREE TO THE PROFESSION.

TAMAR

INDIEN

GRILLON.

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION.

HÆMORRHOIDS, BILIA,

CEREBRAL CONGESTION, HEADACHE,

LOSS OF APPETITE,

INTESTINAL OBSTRUCTIONS, &c.,

By augmenting the peristaltic movement of the intestine without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness; and the same dose always produces the same effect—that is to say, never needs increasing.

It is recommended by the most eminent physicians of Paris, notably Drs. BILLY and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success.

Wholesale—London: E. GRILLON, 47, Southwark Street, London, S.E.
Sold by all Chemists and Druggists, 2s. 6d. a box, stamp included.

FERRATIN

Is THE Iron Preparation corresponding exactly with the Iron Compound which is ingested with Food, and which is found stored up in the tissues, especially in the Liver, as a reserve material for the formation of Blood.

BRITISH MEDICAL JOURNAL writes:—

"Far superior to Bland's Formula, which is considered the best of artificial combinations."

SAMPLES AND FURTHER PARTICULARS SENT FREE TO MEMBERS OF THE MEDICAL PROFESSION ON APPLICATION TO

ESTAB. 1793.]

[INCORP. 1891.]

VIN MARIANI

(ERYTHROXYLON COCA.)

More than 2000 physicians have certified to the immense sustaining, recuperative, and nourishing properties of this wine, which is indicated in cases of

OVER-EXERTION,
NEURASTHENIA,
NERVOUS DEPRESSION
SLEEPLESSNESS,
NERVOUS DEBILITY,
CONVALESCENCE,
VOCAL FATIGUE.

When prescribing it the Medical Profession are strongly advised to specify "VIN MARIANI" in order to avoid the substitution of imitations often worthless, and consequently disappointing in effect.

Price 4s. per Bottle; or 45s. per Dozen. To the Medical Profession any quantity post free, at rate of 42s. dozen, from WILCOX & CO., 239, Oxford-street, London. Illustrated Treatise on Coca Free.

CIGARES DE JOY

ASTHMA-CHRONIC BRONCHITIS

One of these Cigarettes gives IMMEDIATE RELIEF in cases of ASTHMA, CHRONIC BRONCHITIS, HAY FEVER, COUGH, and SHORTNESS OF BREATH, and their daily use effects a COMPLETE CURE. The contraction of the air tubes, which causes tightness of chest and difficulty of breathing, is at once lessened by inhaling the medicated smoke of the Cigarette; a free expectoration ensues, and the breathing organs resume their natural action. Persons who suffer at night with COUGHING, PHLEGM, and SHORT BREATH find them invaluable, as they instantly check the spasm, promote sleep, and allow the patient to pass a good night.

These Cigarettes are perfectly harmless, and can be smoked by ladies, children, and the most delicate patients, as they are pleasant to use and contain no substance capable of deranging the system.

Price 2s. 6d. from WILCOX & CO., 239, Oxford-street, London, and all Chemists. To the Medical Profession, 1s. 10d. post free.

CRYSTALLIZED DIGITALINE

Nativelle.

The Paris Academy of Medicine awarded a prize of 6000 francs to M. Nativelle for the discovery of CRYSTALLIZED Digitaline.

CRYSTALLIZED DIGITALINE (NATIVELLE) is a definite substance that can always be relied on and administered with exactitude. After a few doses the pulsations of the heart become slower, more regular, and more energetic.

Prepared in Bottles of 60 granules, each granule containing a 240th grain (1-milligramme). A Sample, with Opinions of the Press and Medical Profession, free by post from WILCOX & CO., 239, Oxford-street, London. Sold by all Chemists.

WILCOX & CO'S DESICCATED EXTRACT OF MALT

A Concentrated, Nutritive, and Digestive Food for INVALIDS and CHILDREN.

This preparation embodies all the beneficial properties of the most carefully prepared semi-fluid extracts, and possesses the additional advantages of greater richness in DIASTASE and the impossibility of fermentation. This Powder may be eaten between bread-and-butter or dissolved in liquid, and, being a natural solvent of farinaceous material, it is strongly recommended as an adjunct to Children's Food and for ladies whilst nursing.

Prepared only by WILCOX & CO., 239, Oxford-street, London, and put up in large bottles at 2s. 6d. each. Messrs. W. & Co. will be pleased to forward a sample of the above to any of the Medical Profession.

42

Mitchell's CASTOR OIL

THE LANCET of June 8th, 1895, says:—"Mitchell's process of extracting and refining Castor Oil is obviously an improvement which the profession cannot fail to approve, since in removing the great objection to the oil—namely, that of repulsive taste, as well as in securing its full therapeutic effect, it is calculated to assist and to facilitate the administration of a very valuable therapeutic agent."

THE BRITISH MEDICAL JOURNAL of 18th May, 1895, says:—"By Mitchell's cold process the Oil thus obtained has a simple bland taste, resembling olive oil, the nauseous taste associated with the ordinary cold drawn Castor Oil being entirely absent."

THE HOSPITAL of June 8th, 1895, says:—"We have tested the samples sent us, both clinically and chemically, and the results are excellent. We have never yet met with an oil that had not this taste till we tried Mitchell's. We consider this Oil to be the very best we have met with, and can cordially recommend its use to the profession."

Put up in 2-oz., 4-oz., and 8-oz. bottles, and retailed at 6d., 9d., and 1s.

THE KOLA NUT.

"The State Department has been calling upon the United States consuls in Africa for specific information in regard to the kola nut, which, by its peculiar action upon the muscular system, enables the African negroes to make long journeys bearing enormous loads under tropical suns and across difficult country without food. Authentically reported cases prove that even an old negro may carry a 175lb. bag of coffee for leagues by chewing a single nut slowly. Mr. E. P. Porley, U.S. consul at Sierra Leone, has sent in the first report upon the subject, treating of the methods of growing and preparing the nuts. According to him, the natives eat them early in the morning as a stay against ordinary food while travelling, and in the evening to induce sleep."—EVENING NEWS, May 2nd, 1896.

VI-COCOA contains a large percentage of Kola Nuts in its purest and best form.

Sold in 6d. packets, and 9d. and 1s. 6d. tins.

H. GALLAIS, 90, Piccadilly, W. LONDON

Flitwick

A REMARKABLE ENGLISH NATURAL CHALYBEATE.

An unrivalled Specific for ANÆMIA, CHLOROSIS, & GENERAL DEBILITY.

THE LANCET, Oct. 24th, 1891:—"Containing in each gallon more than 170 grains
of iron as per-salt, in a nearly neutral solution, along with certain peaty constituents."

BRITISH MEDICAL JOURNAL, Feb. 11th, 1893:—"The results of 90
analyses show that the water contains a large amount of iron, entirely in the 'ferric' state,
with a moderate amount of alumina and small amounts of lime and magnesia, combined mainly
with sulphuric acid as sulphates; and very marked amounts of the organic compounds derived
from peat, the total iron amounting to 96.5 parts by weight per 100,000 parts by weight of the
water. It has a pleasant acid taste entirely devoid of 'inkiness,' and it is probable that the
peculiar manner in which the iron is held in solution and combination renders it capable of
being readily absorbed and assimilated, and so far as our observations go the water
does not affect the teeth nor produce constipating effects."

LONDON, BRISTOL, HARROGATE, & MITCHAM.

THE LANCET:—"This wine contains a wholesome and palatable proportion of the acid constituents of the grape, with the addition of a desirable proportion of Coca Leaf Extract."

BRITISH MEDICAL JOURNAL:—"Coca-Tonic Champagne" has realised a very important and hitherto unfulfilled desideratum. It proves on examination to be a pure wine, FREE FROM SUGAR, and from any kind of loading."

Prof. R. FRESSENIUS of Wiesbaden:—"Absolutely pure Champagne, sugar-free, with the addition of a small proportion of the coca principle."

It has proved itself a very valuable agent in coping with all cases of Nervous Disorders, such as Neurasthenia, Hysteria, and Insomnia, and has been favourably reported on as a restorative in convalescence after Typhoid, Influenza, &c.

It is more reliable than Sulphonal, Chloral, Bromide, &c.

Sold by all Wine Merchants and Chemists at 2/- and 3/9 per bottle. Samples and descriptive pamphlet free to practising Members of the Medical Profession on application to HERTZ & COLLINGWOOD, 4, Sussex-pl., Leadenhall-st., London, E.C.

tion, and the articles sent by post. — POPE & PLANTS,
Hosiery by Appointment to the Queen, 136, Regent-street,
London, W. — The Profession, Trade, and Hospitals
supplied.

SCROTAL HERNIA.

The apparent hopelessness of treating Neglected Hernia prompts me to lay before the Profession one or two typical cases :—C. R. — was sent to me by one of the surgeons of University College Hospital, with directions to make him a "bag to carry the scrotum." He was a strong, healthy man of about forty, weighing seventeen stone, a captain in the mercantile marine, from which he had been obliged to retire. I found he had a double hernia, and the scrotum about the size of a child's head, which after considerable difficulty I reduced, and expressed my opinion that I could retain. Of the possibility of such a result the patient as well as his surgeon were very incredulous; but the latter observed, "Pray do what you like." After considerable trouble, I am pleased to say the whole mass was retained, and without the usual discomfort. In about a year the patient resumed his usual occupation, and the hernia now gives him no trouble. He was, some two years since shot out of a dogcart with great force, breaking several bones and sustaining very serious injuries; but the truss, under this severe trial, effectually prevented any injury as regards the hernia.

EDWARD HUXLEY, 13, Old Cavendish Street, Oxford Street, W.

UNIVERSAL TUBULAR WATER AND AIR BED

Prize Medals Sanitary Congress, 1878. Industrial Exhibition, York, 1879. Certificate of Honour, Sanitary Congress, 1878.

POCOCK BROTHERS,

Patentees and Sole Manufacturers,
235, SOUTHWARK BRIDGE
ROAD, LONDON.

Brighton, 1881.
International, 1881.
Kensington, 1882.

1. In cost it is less expensive.
2. It is warm and light, and well adapted for a camp or field-bed, being waterproof.
3. It is quickly filled and easily adjusted.
4. It admits of ventilation in the space between the tubes.
5. It can be regulated so as to relieve pressure from any part required.
6. By the addition of tubes it will raise one part of the body higher than the rest.
7. By the temporary removal of one or two tubes it affords room for the introduction of a bedpan.

8. It can be inclined to any angle (even when filled with water) to suit the condition of the patient.
9. It is free from noise and surging, so disagreeable to the invalid on changing his position on a water bed.
10. In case of injury to a tube it can be withdrawn, and a fresh one substituted at a trifling cost, and without loss of time; whereas the ordinary water-bed, if injured in any part (from being in one compartment), is rendered useless.
11. In the treatment of invalids, especially the insane, who are paralysed and have no control over their evacuations, they cannot lie in a pool of wet, the fluid passing away between the tubes.

ITS ADVANTAGES OVER ORDINARY WATER OR AIR BEDS ARE AS ABOVE.

A Point**

worth remembering. It is the "business end" of one of our 5/-

**'BRITISH'
STYLOGRAPHIC PENS**

which are acknowledged on all hands to be the most useful pens made. A perfect luxury to write with, they glide over the paper like a superfine lead pencil, and hold enough ink for a day's incessant writing. Made in 3 qualities, 5/-, 7/- & 12/6, post free. Money returned in full if pen is not liked.

Good for every class of work except shorthand, for that nothing can surpass our Neptune Fountain Pens, 2/6 to 10/6 each. Send for free illustrated catalogue.

**BURGE, WARREN & RIDGLEY,
11, Clerkenwell Green, London, E.C.**

THE SWAN FOUNTAIN PEN.

Manufactured in 3 sizes at 10/6, 16/6, and 25/- each. For Present or Souvenir you could not give anything more useful and appropriate.

1. 14-carat Gold—therefore never corrodes. 2. Iridium-tipped—therefore never wears out. 3. Instantly ready for use. 4. Writes continuously for many hours. 5. Economical—outlasting 20,000 steel pens. 6. Saves fully £15 in cost of steel pens and inkpots. 7. Ink in reservoir always limpid—no evaporation. 8. For every writer in every land a necessity. **FINALLY—A Pen as nearly perfect as the inventive skill of the day can produce. FOR WEDDING AND COMPLIMENTARY PRESENTS, THE IDEAL OBJECT.**

We only require your steel pen and handwriting to select a suitable pen.

THE BANTAM.

QUITE SAFE.
EASILY LEARNED.
NO STEP NEEDED.
VERY FAST.
VERY LIGHT.
UPRIGHT POSITION.
NO CHAIN.

Highly recommended in FIELD.

A Doctor's Opinion.

"DOUNBY, FINTOWN, ORKNEY.
"May 17th, 1895.

"GENTLEMEN,
"The 'Bantam' bicycle you built for me in February is giving me the greatest satisfaction in every way. I consider it, after an extensive experience of various other cycles, the *beau idéal* of a country practitioner's mount.

"Its chief advantages are the following: 1. Lightness.—It has only the weight of a racer with the strength of the heaviest full roadster. 2. Ease.—The rider's position between the wheels is most comfortable and the ease of propulsion is remarkable; the low wheels make it the easiest of all cycles against a head wind—the cyclist's *bête noire*. 3. Cleanliness.—Not only is the rider protected from mud, but the machine itself is very easily kept clean; in place of the five or six pieces of a diamond frame one has only to clean the single bar of the backbone. 4. No Chain.—This is simply an unspeakable relief in every way; the Crypto gearing is by far the most scientific. 5. Perfect Steering.—The 'Bantam' steers as easily as the out-of-date 'Ordinary' and tracks perfectly, and this often saves the tyres from puncture. 6. Compactness.—The 'Bantam' can be stowed in any odd corner and it can easily be taken in any ordinary trap, an advantage that every country practitioner will understand and value. 7. Cheapness.—There is no really first-class cycle in the market that costs so little. In short, if any country practitioner wants the very best machine for practical purposes let him buy a 'Bantam.'

"Yours faithfully, "A. M. SAUNDERS, M.B., C.M."

£100,000 ready to be Lent out

privately in sums from £10 to £1000 to Medical Men, strictly private, and at half the usual interest charged by others, and without sureties or fees. Loans granted at a few hours' notice in any part of the country on Note of Hand alone, repayable by small instalments to suit borrower's convenience. If intending borrowers wish to be treated in a fair and honourable manner, they should avoid loan offices, money lenders, and banks, whose only object is to obtain fees, and apply to the actual private lender, Mr. N. Goldstein, 27A, Goldhurst-terrace, South Hampstead, London, N.W. References to Medical Men if desired. Special easy terms to the Medical Profession.

Money.—Mr. S. Bassett, who has

been established for thirty years, is prepared to make prompt and strictly private Cash Advances at a few hours' notice, without objectionable inquiries or fees of any description, to responsible professional gentlemen and others on THEIR OWN NOTE OF HAND in sums from £20 to £2000, AT A FAIR and REASONABLE RATE OF INTEREST, which can be repaid to suit borrower's own convenience.

Mr. BASSETT wishes it to be understood that he is the ACTUAL LENDER, and is not in any way connected with any Advance Companies or so-called Banks.

Applicants may feel assured that whether entertained or not their business shall be treated with the strictest secrecy and confidence, all communications being personally received and attended to.

Before paying inquiry fees or going to unnecessary trouble, apply in confidence to Mr. S. BASSETT, 285, Oxford-street (near Oxford-circus), London, W.

Reference to Medical Gentlemen if desired.

Money Lent upon Note of Hand

St. Andrew's Hospital for Mental DISEASES, NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President—The Right Honble. the EARL SPENCER, K.G.
Chairman of the Committee of Management—The Most Honble. the Marquis of NORTHAMPTON, K.G.

The Institution is pleasantly situated in a healthy locality, one mile from the London and North-Western or Midland lines, and one and a half hour only from London.
It is surrounded by more than 100 acres of pleasure grounds. Great care is exercised in the classification of the Patients according to their habits and different degrees of mental aberration, so that those who are quiet or convalescent may not associate with those whose minds are more affected.
Ample means of occupation and amusement are provided, including Cricket, Croquet, Lawn Tennis, and Archery. There are also Billiard Rooms and a large Recreation Hall and Theatre.
The terms vary from 25s. to 24 4s. a week, according to the requirements of the case.
Patients paying higher rates can have Special Attendants, Horses, and Carriages; and Private Rooms in the hospital, or in detached villas in the grounds of the hospital; or at Moulton Park, a branch establishment, two miles from the hospital.
There is also a Seaside House, to which Patients may be sent.
For further information apply to the Medical Superintendent.

NORTHWOODS HOUSE WINTERBOURNE, near Bristol.

PRIVATE ASYLUM for LADIES and GENTLEMEN.

Situated in a large park in a healthy and picturesque locality, easily accessible by rail via Bristol, Patchway, or Yate stations. Under the Act of 1890 Voluntary Patients or Boarders can now be received.—For further information see Medical Directory, page 1889; and for terms &c. apply to Dr. EAGER, Resident Physician.

AIX-LA-CHAPELLE
(GERMANY).

The Hot Sulphur Waters of Aix are proved to be very useful in cases of Rheumatism, Rheumatic Gout, and Gout; in exudations of a Scrofulous or Traumatic origin; in effusions, old exudations and thickenings of the tissues arising from wounds and fractures of the bones; in Chronic Skin Diseases, Acne, Furunculosis, Psoriasis, Chronic Eczema; in every form of Syphilitic Affection; in Mercurial Poisoning and Lead Palsy; in Chronic Catarrhal Affections of the Respiratory and the Digestive System; in Paralysis of Brain and Spine in Tabes.

The Baths are established on the newest scientific principles: Ordinary Baths, Douche Baths with the water regulated to the required degree of heat; Douches of Thermal Water, Shower Baths, Natural Vapour Baths, Massage, Calisthenic Exercises by Mechanical means, &c.

The Season goes on and the Baths can be used throughout the year. The hotels at Aix are comfortable, prices moderate, and the country round pretty.

Visitors can arrange at the Hotels and Bath houses, Pension or board and lodging at a moderate fixed sum per day.

Letters can be addressed to the

*Municipal Board of Baths,
 Aix-la-Chapelle.*

R. ADDISON SMITH, Clerk and Treasurer.

19, Heriot-row, Edinburgh, 15th June, 1895.

THE SCHOLASTIC, CLERICAL, & MEDICAL ASSOCIATION, LTD.

MEDICAL DEPARTMENT.

This Association was established in 1880 as a Limited Liability Company under the direction of professional men, its object being the creation of a RESPONSIBLE and THOROUGHLY TRUSTWORTHY Agency. The Medical Department has met with so great success that it has been found necessary for one of the Managing Directors (Mr. G. B. Stocker) to devote his whole attention thereto; and he has the assistance of an experienced Medical Accountant and a large staff of clerks. Further, a Board composed entirely of gentlemen of high standing in the Medical Profession has been appointed, and to them matters of dispute and complaint are referred.

The Association undertakes the SALE of PRACTICES and PARTNERSHIPS; the introduction of LOCUM TENENS and ASSISTANTS; MEDICAL ACCOUNTANCY (by a duly qualified Medical Accountant); INVESTIGATION and VALUATION of Practices, &c.; POSTING BOOKS and sending out Bills, &c., &c.

A Pamphlet relating to the Medical Department, with the names of the "Directors" and "The Medical Advising Board," and terms, will be sent on application to—MR. G. B. STOCKER, MANAGING DIRECTOR, 8, LANCASTER PLACE, STRAND, W.C.

Telegraphic Address—"Triform, London."

MEDICAL PARTNERSHIP AND CONVEYANCING AGENCY.

1, ADAM-STREET, ADELPHI, W.C.

The SALE of PRACTICES and PARTNERSHIPS NEGOTIATED. Trustworthy LOCUM TENENS and ASSISTANTS can be had at a few hours' notice.

N.B.—No charge made to Purchasers.

Notice.—Mr. J. C. Needes, with an

experience of over a quarter of a century, is in an exceptional position to give intending Purchasers independent information concerning most PRACTICES and PARTNERSHIPS. Those investments in the following List marked with an asterisk are well known to him, having been purchased through his Office by the present Incumbents years ago, and in many other cases an introduction can be given to gentlemen who have taken charge of the Practices during the absence of the Incumbents.

£300 to £1000 A YEAR.—An old-established PRACTICE, averaging the above amount, situated in an attractive locality within twenty miles of London, is for immediate negotiation. Visits 2s. 6d. to £11s. Midwifery 1 to 5 guineas. Appointments yield £200 per annum.

SURREY.—Increasing PRACTICE, yielding between £450 and £500 cash receipts last year. Pleasant residential locality within forty minutes' run of London. A horse not kept. Detached residence, rent £45 per annum. Appointments yield £160 a year. Premium £50.

CHEAP INVESTMENT. The very moderate sum of £600 will be accepted for a PRACTICE worth £750 per annum, situated in a large provincial city. Held by present Incumbent seven years, who is compelled to relinquish through ill health. Light expenses. Convenient residence. Capable of great increase.

LONDON SUBURB, S.W.—Well-established PRACTICE worth between £900 and £700 per annum, and capable of increase. Easily worked. Neither horse nor assistant required. The residence is situated in a good-class thoroughfare, and has large garden attached. There is a Branch Surgery near, at which about half the income is received in ready money fees. Premium £800. Incumbent has held the Practice for twelve years.

* **PARTNERSHIP.**—SOUTH OF ENGLAND.—A junior PARTNER required in an established Practice situated in a town of 12,000 inhabitants on the coast. Appointments held worth over £200. Fifty cases of midwifery yearly. The share for disposal will yield between £250 and £300 per annum. Premium required, £300.

DEATH VACANCY.—The leading PRACTICE in a town of 20,000 inhabitants in Yorkshire is for immediate disposal, owing to the decease of the Incumbent. The bookings of the Practice (exclusive of appointments) amount to about £2000 per annum. Midwifery 15s. to £5 5s. The late Incumbent held an excellent position in the neighbourhood, and a good introduction can be given to the successor, with whom the present Assistant would be willing to remain if wished. Moderate premium accepted from a prompt purchaser. Grammar School in the town.

£1300 A YEAR. ONE YEAR'S PURCHASE will be accepted for a very old-established PRACTICE in a wealthy district within a few miles of a manufacturing town. The present Incumbent has held the Practice over twenty years. It is easily worked, and appointments are held worth £100 per annum. Capital residence suitable for a family, with garden, tennis lawn, stabling, and paddock attached.

SOUTH.—In a pleasant Country Town within an hour's run of London, a well-established PRACTICE yielding between £500 and £650 last year, inclusive of appointments £70. Patients include all classes, and the visiting fees are 2s. 6d. to 10s. 6d. Two horses required. Commodious residence, with large garden and stabling. Educational advantages. Premium £1000.

* **A SUCCESSOR** (who should be of the Roman Catholic persuasion) is required for a well-established practice averaging over £1250 per annum cash receipts. It is situated in the best part of a large provincial city, and the connexion is amongst the upper and middle classes. Visits principally 3s. 6d. and 5s. Midwifery £1 10s. to £3 5s. The expenses are very moderate; an assistant not kept, and one horse sufficient. The house is vendor's property and can be rented at about £50 per annum. Six months' introduction given.

£1500 A YEAR.—LUCRATIVE PRACTICE.—The income is derived in about equal proportions from the connexion attached to the private residence and from the fees received in ready cash at a branch surgery (a quarter of a mile distant), where a qualified assistant resides. The Practice is situated in an open South-western suburb.

Mr. Needes has another similar investment in London, where the income is almost entirely ready money, and residence on the premises is not necessary.

Apply to J. C. NEEDES, 1, Adam-street, Adelphi, W.C.

Locum Tenens and Temporary

ASSISTANTS.—Practitioners requiring the above can immediately obtain thoroughly reliable qualified Gentlemen upon application to 1, Adam-street, Adelphi, W.C. Every Gentleman engaged by the Office in either of the above capacities is personally known to Mr. J. C. Needes. An office fee of half a guinea is payable by the Principal.

Established over fifty years.

MEDICAL REFERERS, VALUERS, and ARBITRATORS.

QUALIFIED ASSISTANTS and LOCUM TENENS PROVIDED.

1. **PARTNERSHIP.**—A qualified Gentleman, who is accustomed to General Practice, is required as Partner in a very old-established Private Practice, situate in a London suburb. Income between £1500 and £1600 per annum. Has been conducted by present Practitioner many years.
2. **COUNTRY TOWN.**—A very old-established PRACTICE for Disposal, in a Western County. Income about £300 per annum, including about £100 from appointments. A desirable house, good garden and stabling. Three months' introduction. Will bear every investigation.
3. **WEST END.**—An old-established first-class PRACTICE. Income about £4000 per annum. Rent of house £300. Visiting fees, 7s. 6d. to 21s., very little Midwifery.
4. **IN A YORKSHIRE TOWN.**—An old-established PRACTICE, producing from £1100 to £1200 per annum. The vendor has held it twenty-five years, and is now retiring. A good detached house, with stabling attached, the freehold of the present Incumbent. Favourable terms can be arranged with an immediate purchaser.
5. **LONDON, E. (leading thoroughfare).**—A General PRACTICE, established nearly a century, is for immediate Disposal in consequence of ill-health of the present Practitioner. Average income about £700 per annum, including appointments of £100 per annum. About forty Midwifery cases a year, from 21s. to 42s. Premium £650, with two months' introduction. Good house; rent £42; held on lease. Working expenses very light. Will bear the strictest investigation.
6. **PARTNERSHIP** in a residential district near a large Midland town. The Half-share is offered to a suitable gentleman. Present amount of income is about £1200, inclusive of appointments. A detached house, with garden and stabling, can be had.
7. **ON EASY TERMS.**—An old-established Ready Money Fee PRACTICE, producing about £900 per annum, situate in a leading thoroughfare east of the Bank. A convenient house, with well-fitted open surgery, held on lease. Three months' introduction. An immediate purchaser can arrange advantageous terms.

* Several other PRACTICES for disposal.

MEDICAL TRANSFER AND PARTNERSHIP.

32, Ludgate-hill.

Messrs. Orridge & Co., Medical

Transfer Agents, Referees, and Valuers, in offering their services to the Profession, have pleasure in referring to the fact that for ABOUT HALF A CENTURY the name of Mr. ORRIDGE has been known in the advertising columns of the leading medical journals, and that a very large proportion of the Medical Men throughout the kingdom have confided their interests in the adjustment of PARTNERSHIPS and TRANSFERS to their care.

Purchasers who will communicate (confidentially) the NATURE and EXTENT of their wishes regarding investment can be apprised of appropriate opportunities as they occur.

On occasions where ADVICE is required in forming a correct conclusion as to the worth or eligibility of a Practice, Messrs. ORRIDGE & Co. trust that their familiarity with the various contingencies that govern value will be found of considerable service to those by whom they are employed. N.B.—No charge is made to purchasers.

MEDICAL TRANSFER AGENCY (ESTAB. 1860).**Mr. Herbert Needes (son of the late**

Mrs. Needes, and for more than ten years associated with her in the management of this old Agency) is still carrying on the Business, and will be glad to negotiate the Transfer of PRACTICES and PARTNERSHIPS on the usual terms. No connexion with any other office.

LOCUM TENENS.—Reliable Gentlemen always on the Books.

ASSISTANTS provided free of charge to Principals.

UNOPPOSED PRACTICE of £900 A YEAR situate within ninety miles of town. Transferable. Union and Club appointments of £250. Fees good. Capital field sports. Convenient family residence standing in its own grounds, rent £55. Owing to exceptional circumstances a prompt purchaser can secure this practice at a very moderate premium. Apply personally where possible.

PARTNERSHIP.—A JUNIOR PARTNER required in a rising Practice, situate in a pleasant county town near London. There is ample scope for an active young gentleman (Bachelor preferred). An income of £150 guaranteed the first year. Premium, £150 cash. Mr. Needes can personally recommend this.

£200.—NUCLEUS. This sum will purchase the Nucleus of an old-established Practice situate in a good-class residential Suburb (S.W.). Receipts last year over £200. Transferable appointments £75. Capital house; rent £60. Splendid opening for one with small reserve capital.

SUSSEX.—£130 accepted for a small Country PRACTICE, at present returning over £230 per annum, but capable of much further extension, as a union appointment and several clubs are likely to fall to a prompt buyer. Good house, with large gardens, stabling, and paddock; rent £40.

NEAR THE WEST END.—In an attractive open locality, a superior-class Cash and Private PRACTICE offers for negotiation through the ill-health of the incumbent. Now doing about £600 per annum and increasing. Most conveniently arranged house on lease. Premium, with a good introduction, £500.

IMMEDIATE.—A BARGAIN.—£250 accepted for a well-established Private Cash PRACTICE, situate within five miles of the Bank. Receipts last year £470, including £70 from transferable Clubs. House on the main road; rent £30. Strictest investigation.

YORKS.—£700 PER ANNUM.—The Practice is old-established and is situated in a well-built and non-smoke town. About forty consultations. No horse kept. Ample scope for an active man. Good house, well situate, with stabling; rent £30. Premium, with six months' introduction, £900.

£20 PER WEEK.—FOR SALE. One of the oldest PRACTICES in the East End of London. Only changed hands once in the past thirty years. Cash Practice with retail managed entirely by Assistant. Surgery fee 1s. Rent of house in prominent position, £80. Price, to include stock, £400. Capital investment for one's money.

REQUIRED IN HEREFORDSHIRE, SALOP, or adjoining counties, a PRACTICE of £1000 a year, with bracing climate, good hunting, shooting, and fishing. Details in confidence to Mr. Herbert Needes.

to Let at a moderate rent. Just being vacated by a Doctor, to
whom reference may be made.—Apply to Medicus, Gurney's Library,
35, South Molton-street, W.

Seven years' lease of 10-roomed

house, with garden, in best part of Mile End-road, for sale. There
is a small nucleus of practice, as the house has been occupied by a
doctor for seven years. Ground rent £7. Price £175.—Address,
Doctor, THE LANCET Office, 423, Strand, W.C.

Monmouthshire (close to Station).—

To be Let, Furnished, on lease, a charming MANSION, contain-
ing five reception-, billiard-, and seventeen bed-rooms. Heated by hot
water and lighted by electricity. Very suitable for a medical man with
Private Patients. Good opening for practice. Low rental. Sketch at
offices.—Messrs. John D. Wood & Co., 6, Mount-street, W.

Consulting-rooms.—To be Let, in

the house of an old-established Dentist in most central part of
West-end, good CONSULTING-ROOM and Small Room adjoining, with
joint use of well-furnished waiting-room, all on ground floor. Also
Bed- and Dressing-room on third floor. Manservant.—Apply, J. H.,
care of Messrs. Nash and Tuten, 4, Saville-place, W.

Wanted to Purchase a good-class

PRACTICE, either in Town, Suburbs, or Country district.
Should prefer a Practice producing about £800 per annum, but would
entertain any Practice of over £400, with scope for increase, and would
pay one and a-half year's to two years' purchase, or even more, for a really
good opening. Anxious to purchase at once.—Address, D. M.,
THE LANCET Office, 423, Strand, W.C.

Wanted immediately, in the South

or West of England, a small PRACTICE of not less than £350
per annum. Small town or country Practice preferred.—Address,
Doctor, Cross Farm, Yetminster, Dorset.

Wanted, a middle-class Practice,

doing £300 to £500 a year either in a large town or country. Ad-
vertiser would invest £700 or £800 in a good partnership. Age twenty-
seven.—Address, C., THE LANCET Office, 423, Strand, W.C.

Wanted, in London or Suburbs,

transferable Middle-class PRACTICE of £400 to £600 per
annum. S.W. or S.E. preferred, but not essential. Advertiser is pre-
pared to pay cash and to enter on duties at once.—Address, H. A. W.,
THE LANCET Office, 423, Strand, W.C.

Wanted, a small Practice of £400

or so in a Country Town. Advertiser is an M.D. Edin., un-
married. Midwifery and appointments not objected to. A good-class
Partnership would be entertained.—Address, Expectant, THE LANCET
Office, 423, Strand, W.C.

Partnership, Practice, or Assistant-

SHIP, with view to Partnership or ultimate succession, desired
by B.Sc., M.R.C.S., L.R.C.P. Lond., with four years' experience in
private practice. Age thirty-two. Married, no children. Church of
England. Highest testimonials and social references.—Address,
Dunley-Owen, Uttoxeter.

Wanted, to meet with an elderly

Practitioner who would be willing to receive a WORKING
PARTNER on easy terms. Advertiser is M.R.C.S. Eng., L.R.C.P. Lond.,
late House Physician, and has had large experience in general practice.
Churchman. Accustomed to good society. Aged thirty. Light
weight. Used to hard work.—Address, Fidelis, THE LANCET Office, 423,
Strand, W.C.

Partnership.—Half-share in rapidly

increasing Practice of about £600, with recently established
Branch, at which income could reside. Suitable man accented on
payment of part of purchase money. Remainder to be arranged for out
of receipts. London rapidly growing suburb.—Address, Distaff,
THE LANCET Office, 423, Strand, W.C.

Partnership, with view to succes-

sion, required by a treble qualified Gentleman, in a good-class
Practice. Within half to three-quarters of an hour of town. Nice
house available, with garden, &c. Advertiser is an M.B. Lond., aged
twenty-nine, experienced. Ride and drive. Can invest up to £1000.—
Address, T. A. L. C., THE LANCET Office, 423, Strand, W.C.

For immediate disposal, a small, old-

established Country PRACTICE, near Manchester, of £250 per
annum, including £25 from transferable clubs, which can be increased.
Good golfing, shooting, and fishing in the neighbourhood.—Address,
Spes, 571, Eccles New-road, Eccles, Manchester.

Death Vacancy.—Old-established

PRACTICE for Sale. Densely populated London district.—
Medico, THE LANCET Office, 423, Strand, W.C.

London, N.—Old-established Private

PRACTICE for Sale. Suit active man aged thirty to thirty-five.
Vendor retiring. Premium £1500. No agents.—Address, with name,
Eustace, THE LANCET Office, 423, Strand, W.C.

Dispensary for immediate Disposal,

S.W.—This is an exceptional opportunity of acquiring a sub-
stantial nucleus to a large cash Practice. Established little over two
months. Receipts already average £2 weekly; increasing. Has been
worked entirely by an assistant. Premium, to include fixtures and
turniture, £45; payable £25 down, balance in three months based upon
receipts.—Address, Francis, THE LANCET Office, 423, Strand, W.C.

Urgent reasons for immediate Sale

of PRACTICE of over £400. Very old established. Totally un-
opposed, and, owing to special circumstances, will greatly increase after
this year. Good fees. No bad debts. Working expenses nominal.
Most beautiful and interesting country district. Society. Excellent
fishing, shooting, hunting. Cheap to prompt cash purchaser.—Address,
Practice, care of Mr. James Logan, 95, Bath-street, Glasgow.

Surgery or Dispensary to Let in

Fulham. A good shop and house, already fitted for the above.
Rent low.—Apply to Mr. James Pike, 63, Brompton-road.

Sale or Exchange.—Cash Practice

(£260), S.W., with plenty of scope for increase; or a good man with
a little capital by taking another residence besides, and now obtainable,
could secure a good Practice. Satisfactory reasons.—Address, Beta,
THE LANCET Office, 423, Strand, W.C.

For Disposal, High-class Non-dis-

pensing PRACTICE in one of the best London suburbs. Par-
ticulars will be furnished to well qualified and otherwise suitable
applicants by C. H. Wells, Medical School Office, Guy's Hospital, S.E.

Yorkshire.—For Sale, genuine and

very old-established, all private, Middle- and Working-class PRACTICE, near large town. £400 a year. May be greatly increased. Vendor having for years refused much night work, midwifery, clubs, and parish work. Visits, 1s. 6d.; mixtures, 2s.; 2s. 6d.; Midwifery, 15s.; 21s. Rent (rates and taxes) under £30. No assistant or horse necessary, as trams and rails are handy. Bad payers wasted out every year for thirty years, and Practice very easily worked. Opponents plentiful, but all young and inexperienced. Price two years purchase.—Address, Halifax, THE LANCET Office, 423, Strand, W.C.

Unopposed Practice of £900 a year,

situate within ninety miles of Town. Transferable Union and Club Appointments of £250. Fees good. Capital field sports. Convenient family residence standing in its own grounds, rent £50. Owing to exceptional circumstances a prompt purchaser can secure this Practice at a very moderate premium.—Apply to Mr. Herbert Needes, 168, Euston-road, N.W.

For Sale, for £1250, a Practice,

including good house and two even ground, in small town on line of railway in Cape Colony. Owner going to England. Splendid opportunity for delicate practitioner, or exchange of practices might be arranged. Annual income £700 to £800.—Address, M.D., THE LANCET Office, 423, Strand, W.C.

Australia.—Colony of Victoria.—

For Disposal, unopposed Medical PRACTICE, convenient to Melbourne; township popular sea-side resort; charmingly situated; excellent farming district. Average returns, for a period of four years, are over £700 per annum in book debts and £550 per annum in cash (last year £578 10s.). Appointments £120 per annum. Capable of being increased by at least a third. Work very light. Sult gentleman in delicate health. Climate delightful, no frost or snow.

Price of Practice and furniture of house is £550, or advertiser might possibly exchange for Practice of similar value in England.

Apply, in first instance, D. C. J., 14, Brooke-street, Bradford, Manchester, England.

Assistants and Locum Tenens sup-

plied on the shortest notice. Apply to G. B. Stocker, Esq., Secretary, Medical &c. Assn., Ltd., 8, Lancaster-place, Strand, W.C. The rule of the Association is that no Assistant shall be recommended till direct inquiries have been made as to his antecedents. Names of the Committee of Management and descriptive pamphlet on application.—Telegraphic address, "Trilfrom, London."

Locum Tenens.—Disengaged from

July 4th, M.R.C.S., L.R.C.P.; registered 1883. Age thirty-seven. Married. Terms, three weeks and over, £22s. per week. Under three weeks £2 10s. References from late employers.—X., care of Mr. Shoesmith, Stationer, Crickwood.

A Locum Tenens seeks an Engage-

ment. Free from present work this week. Rides and drives. University College man. Terms 3 guineas and expenses. References &c. forwarded.—Address, Xylol, care of Dr. Evers, Albion House, Faversham, Kent.

Locum Tenency wanted, for any

length of time, by qualified Practitioner (M.B., C.M. Glasg.); married.—Reply, stating terms and full particulars, to Medicus, 182, Langside-road, Glasgow. England preferred.

Wanted, a qualified Married Gentle-

man to act as LOCUM TENENS in a Suburban Practice for two or three weeks in July. Residence for self and wife and 4 guineas a week remuneration offered. No board. Not much work.—Address, Mastoid, THE LANCET Office, 423, Strand, W.C.

Locum Tenens.—A registered M.D.,

ASSISTANT'S AGREEMENT FOR SERVICES. "This is a form of agreement which principals may find useful in engaging Assistants. It is very explicit."—THE LANCET, February 9th, 1895. It contains all the conditions of the usual bond as well as several useful and necessary clauses. Stamped copies, price 11s. Entered at the Stationers' Hall, and can only be obtained from RICHARDSON BROS. & CO., Medical Agents, Liverpool. ASSISTANTS and LOCUM TENENS supplied.

NOTICE.

WITH regard to advertisements affecting unqualified assistants, the Proprietors of THE LANCET think it right to point out that they obviously cannot guarantee that each individual advertiser offers his services under such conditions as would be approved by the General Medical Council. The Proprietors consider that inconvenience to practitioners and hardship to unqualified assistants may be caused by the entire exclusion of these advertisements from the columns of THE LANCET. The General Medical Council do not, it is understood, object to unqualified assistants being employed by practitioners when resident in or near their employers' houses, but the Council will not allow unqualified persons to conduct branch practices, or dispensaries which are situated at a distance from the principal's house and are not under his immediate supervision.

To Medical Men and Firms.—

Wanted, re-engagement as DISPENSER or Dispenser and Bookkeeper. Thoroughly experienced in all branches of Dispensing, neat, quick, and accurate. Good references and testimonials. Salary moderate; out-door. Disengaged shortly.—Address, H. Brice, 66, Llantrisant-road, Pontypridd.

Complete Price List also Dr. H. A. Martin's Pamphlet describing Method of Treatment post free on application to the Sole Agents—**KROHNE & SEEMANN, Surgical Instrument Makers, 2, John Street, Manchester Square, London.**

BROMIDIA.

“ALTHOUGH opposed to the use of pharmaceutical specialities I was struck with the formula of **BROMIDIA** (Battle), and, knowing the action of its ingredients, could not bring myself to believe in its possessing greater therapeutic power than its component parts. However, I determined to try it in a severe case of Mammary Neuralgia which had proved refractory to an infinitude of other remedies. The result was brilliant, and far beyond my expectations. I then made experiments with a preparation made according to the formula of **BROMIDIA** by an experienced pharmacist, but whether due to the greater purity of your drugs, or special mode of combining, the results were not to be compared with those of **BROMIDIA** (Battle).”

“DR. ORAZIO SATARIANO.

“*Barrafranca, Italy.*”

“1, Ditton Road, Surbiton, England,
“May 26th, 1894.”

“GENTLEMEN,—I have had occasion to use **BROMIDIA** for some years. My object in asking you for a fresh sample recently was to test the persistent purity and efficacy of the preparation. I have much pleasure in assuring you that **BROMIDIA** in my own practice is as efficacious at present as it has been in the past.

“Believe me, Gentlemen, faithfully yours,

“——— L.R.C.P., M.R.C.S.”

CAUTION.

The great reputation of **BROMIDIA** has frequently caused cheap and inefficient imitations to be dispensed as **Bromidia**. Some of these substitutes are not only worthless, but absolutely harmful.

As a precaution, it is not only necessary to specify **BATTLE'S BROMIDIA**, but also to see that the patient obtains the genuine preparation.

A Sample Bottle of BROMIDIA and Pamphlet will be forwarded free of charge to Medical Men on application to

ROBERTS & CO., 76, New Bond Street, London.

GENERAL DEPOT FOR GREAT BRITAIN.

The PUMP HOUSE, LAKE HOTEL, and BATHS, LLANGAMMARCH WELLS, CENTRAL WALES.

Telegraphic Address—"BARIUM, LLANGAMMARCH WELLS."

[For Terms apply to "MANAGERESS."

(CENTRAL WALES.)

BARIUM WATER.

(ALTITUDE 600 ft.)

LLANGAMMARCH WELLS, noted for its celebrated Barium Spring. This first-class Hotel, standing in its own ornamental grounds, is situated on the slope of the Epynt Hills, and looks down one of the most beautiful valleys of Wales. All the rooms have been furnished with every regard to comfort for visitors. The sanitary drainage and water supply, both of the Hotel, Pump House, and Baths, have been carried out on the most modern principles. Capital boating on a picturesque lake. There is splendid Salmon and Trout Fishing in the River Irfon, a tributary of the Wye. Over two miles of this charming river flows through the hotel grounds and is reserved for visitors. Visitors staying at the Hotel have the privilege of Shooting over several thousand acres of Mountain and Moorland.

RESULT OF ANALYSIS BY DR. DUPRÉ, August, 1883:—

"A Sample contained in two Winchester quart bottles, stoppered, from Llangammarch Springs. The water is clear, slightly saline taste, holds but little Carbonic Acid in solution, and contains per gallon:—

Chloride of Sodium	189.56
Chloride of Calcium	84.56
Chloride of Magnesium	24.31
CHLORIDE OF BARIUM	6.26
Carbonate of Calcium	2.80
Silica	1.40

308.89 grains per gallon.

"A. DUPRÉ.

"Westminster Hospital, August 23rd, 1883."

As a remedial agent **BARIUM** ranks high in cases of Strumous Disease in its protean forms, Glandular Enlargements, Scrofula, Chronic Rheumatism, Epilepsy, and Diseases of the Heart. It is also useful in other Diseases, such as Liver Derangements, &c.

It has been stated in a recently published work on Chronic Diseases of the Heart, as the result of experiment, that the Mineral Waters of Llangammarch, employed as baths as well as taken internally, exercise healing effects similar to those of the celebrated springs of Nauheim in Germany. The Proprietors of the Llangammarch Wells have, therefore, secured the attendance at the Pump Room and Bath House, on and from the 17th June, of a Physician who is practically acquainted with the methods employed by Dr. Schott at Nauheim for the relief of Gout, Rheumatism, and Heart Affections.

Extract from THE LANCET, Nov. 24th, 1894:—

"A sample of the barium water was obtained, sealed, and despatched to THE LANCET Laboratory for detailed examination, and the results may be compared with the analysis of the sample first submitted. In the following analysis Sample 1 is the sample obtained by ourselves, and Sample 2 the sample first submitted. The results are expressed in grains per gallon (70,000 grains):—

	No. 1.	No. 2.
Chloride of barium	6.749	6.490
Chloride of sodium	186.200	185.900
Chloride of calcium	85.160	85.470
Chloride of magnesium	20.100	20.315
Chloride of lithium	0.847	0.910
Chloride of ammonium	0.262	0.262
Alumina and silica	3.340	3.100
Bromine as bromide	Distinct traces	Distinct traces

Total mineral matters ... 302.658 ... 302.447

"It is important and interesting to observe that the quantity of barium salt has varied only within very small limits during the last ten years, as in 1883 Dr. Dupré made an analysis, in which he found 6.26 grains of barium chloride per gallon. The amount of chloride of barium may therefore be fairly regarded as constant—a fact which is of especial importance in view of the powerful action of barium salts.

THE LAKE, LLANGAMMARCH WELLS.

"The quantity of barium present renders the internal administration of the Llangammarch waters quite safe, and no harm could result from drinking the water in reasonably large amounts." "One tumblerful is a sufficient dose in most cases, and two tumblerfuls should seldom, if ever, be exceeded, though the dose may be repeated three or four times a day."

Extract from the MEDICAL ANNUAL, 1890:—

"Heart—new treatment.—Continued trial has affirmed the efficacy of **BARIUM CHLORIDE** as a cardiac tonic. It has been found to slacken and regulate the heart-beat and to augment the amplitude of the pulse without producing as much increase in the arterial tension as does digitalis. Da Costa and Hare have both added their experience of the drug to the published statements of Boehm, Kobert, Bacey, Lauder Brunton, and Bartholin on this subject. Da Costa finds that it can be taken for a long time without disordering the stomach, that it has some diuretic action, and that it has the valuable property of lessening cardiac pain—a statement which Hare confirms. The latter has obtained good results from the use of Barium Chloride in both mitral diseases, in acute dilatation of the heart, and in functional derangement of the heart. H. A. Haze (JOURNAL DE MÉDECINE DE PARIS) has obtained good results from its use in all the above diseases, and also in aortic diseases as well.

"Glandular Enlargement.—An eminent London Physician writes:—My experience in the two cases which I sent to Llangammarch has been eminently satisfactory, and the well-recognised efficacy of the Kreuznach waters in glandular enlargement encourages the hope that the waters of Llangammarch may prove to be of signal and widespread benefit in the future."

THE BARIUM SPRINGS.

been eminently satisfactory, and the well-recognised efficacy of the Kreuznach waters in glandular enlargement encourages the hope that the waters of Llangammarch may prove to be of signal and widespread benefit in the future."

BARIUM WATER is supplied, both Still and Aërated, by the London Agents—

INGRAM & ROYLE, Ltd., 52, Farringdon St., E.C. [Telegraphic Address: "Ingram Royle, London."

SQUIRE'S CHEMICAL FOOD.

Known for thirty years as the best preparation of its kind for delicate children.

ALWAYS UNIFORM.

Substitutes, more or less emphatically stated to be made from a published formula, vary enormously in the quantities of Iron and Lime, and also in acidity. (See "*Squire's Companion to the British Pharmacopœia.*")

SQUIRE'S SOLUTION OF BIMECONATE OF MORPHIA.

A PURIFIED SOLUTION OF OPIUM STANDARDISED TO CONTAIN 1 PER CENT. OF MORPHINE.

A valuable sedative without the objectionable after-effects of opium.

The Solution of the British Pharmacopœia is very different from this, and is no substitute for it.
